

Important Information for Optimizing Your Graphics Performance

You can improve the graphics performance of your Internet PC by increasing the amount of memory allocated to video. To do this, complete the following steps:

1. From the Windows taskbar, select **Start/Settings/Control Panel**.
2. Double-click **Display**.
3. Select the **Settings** tab.
4. Click **Advanced**.
5. Select the **Memory** tab.
6. Select the desired memory allocation from the drop-down menu, using the following guidelines:
 - If you have a total of 32 MB of system memory, the allocated 4 MB of video memory will enable running most 3D applications. If you have difficulty running 3D applications, you should install additional system memory. Adding system memory and allocating 8 MB to video memory can improve graphic performance.
 - If you have a total of 64 MB of system memory, you may allocate up to 8 MB to video memory. This can improve graphic performance.
7. In order for the change to take effect, you must restart your computer.
