### Index ............................................................................... 99
This maintenance and service guide provides information to help you:

- Service the MSA1500 cs
- Troubleshoot the MSA1500 cs
- Reference the MSA1500 cs

**WARNING:** To reduce the risk of personal injury from electric shock and hazardous energy levels, only authorized service technicians should attempt to repair this equipment. Improper repairs can create conditions that are hazardous.

**WARNING:** Only authorized technicians trained by HP should attempt to repair this equipment. All troubleshooting and repair procedures are detailed to allow only subassembly/module-level repair. Because of the complexity of the individual boards and subassemblies, no one should attempt to make repairs at the component level or to make modifications to any printed wiring board. Improper repairs can create a safety hazard.

**WARNING:** To reduce the risk of personal injury from electric shock and hazardous energy levels, do not exceed the level of repairs specified in these procedures. Because of the complexity of the individual boards and subassemblies, do not attempt to make repairs at the component level or to make modifications to any printed wiring board. Improper repairs can create conditions that are hazardous.

**WARNING:** To reduce the risk of electric shock or damage to the equipment:

- Disconnect power from the system by unplugging all power cords from the power supplies.
- Do not disable the power cord grounding plug. The grounding plug is an important safety feature.
- Plug the power cord into a grounded (earthed) electrical outlet that is easily accessible at all times.
Caution: To properly ventilate the system, you must provide at least 7.6 cm (3.0 in.) of clearance at the front and back of the server.

Caution: The computer is designed to be electrically grounded (earthed). To ensure proper operation, plug the AC power cord into a properly grounded AC outlet only.

Note: Any indications of component replacement or printed wiring board modifications may void any warranty.

“About This Guide” topics include:
- Overview, page 9
- Conventions, page 10
- Rack stability, page 12
- Getting help, page 12
Overview

This section covers the following topics:

- Intended audience
- Prerequisites
- Related documentation

Intended audience

This book is intended for use by system administrators and technicians who are experienced with the following:

- SAN management
- Network administration
- Network installation

Prerequisites

Before you service the MSA1500 cs, make sure you consider the items below.

- Knowledge of operation system
- Knowledge of related hardware/software
- Previous version of the product/firmware

Related documentation

In addition to this guide, HP provides corresponding information:

- HP StorageWorks MSA1500 cs Configuration Overview
  This poster illustrates common MSA1500 cs deployments and includes a checklist and worksheet for you complete, to help ensure that you have all of the items needed for your MSA1500 cs installation.
  The poster is a companion piece to this Installation Guide.

- HP StorageWorks Modular Smart Array 1500 cs Installation Guide
  This guide contains basic information about installing the MSA1500 cs.

- Command Line Interface Reference Guide
  This guide contains information about using the CLI.

- HP StorageWorks Modular Smart Array 1000 Controller Reference Guide
  This guide defines MSA1000 Controller display messages and discusses other controller reference information.

- HP Array Configuration Utility User Guide
  This guide contains information about using the ACU.

Conventions

Conventions consist of the following:

- Document conventions
- Text symbols
- Equipment symbols

Document conventions

This document follows the conventions in Table 1.

Table 1: Document Conventions

<table>
<thead>
<tr>
<th>Convention</th>
<th>Element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue text: Figure 1</td>
<td>Cross-reference links</td>
</tr>
<tr>
<td>Bold</td>
<td>Menu items, buttons, and key, tab, and box names</td>
</tr>
<tr>
<td>Italics</td>
<td>Text emphasis and document titles in body text</td>
</tr>
<tr>
<td>Monospace font</td>
<td>User input, commands, code, file and directory names, and system responses (output and messages)</td>
</tr>
<tr>
<td>Monospace, italic font</td>
<td>Command-line and code variables</td>
</tr>
<tr>
<td>Blue underlined sans serif font text (<a href="http://www.hp.com">http://www.hp.com</a>)</td>
<td>Web site addresses</td>
</tr>
</tbody>
</table>

Text symbols

The following symbols may be found in the text of this guide. They have the following meanings:

---

**WARNING:** Text set off in this manner indicates that failure to follow directions in the warning could result in bodily harm or death.
---

**Caution:** Text set off in this manner indicates that failure to follow directions could result in damage to equipment or data.
---

**Tip:** Text in a tip provides additional help to readers by providing nonessential or optional techniques, procedures, or shortcuts.
Equipment symbols

The following equipment symbols may be found on hardware for which this guide pertains. They have the following meanings:

- Any enclosed surface or area of the equipment marked with these symbols indicates the presence of electrical shock hazards. Enclosed area contains no operator serviceable parts.
  
  **WARNING:** To reduce the risk of personal injury from electrical shock hazards, do not open this enclosure.

- Any RJ-45 receptacle marked with these symbols indicates a network interface connection.
  
  **WARNING:** To reduce the risk of electrical shock, fire, or damage to the equipment, do not plug telephone or telecommunications connectors into this receptacle.

- Any surface or area of the equipment marked with these symbols indicates the presence of a hot surface or hot component. Contact with this surface could result in injury.
  
  **WARNING:** To reduce the risk of personal injury from a hot component, allow the surface to cool before touching.

- Power supplies or systems marked with these symbols indicate the presence of multiple sources of power.
  
  **WARNING:** To reduce the risk of personal injury from electrical shock, remove all power cords to completely disconnect power from the power supplies and systems.

- Any product or assembly marked with these symbols indicates that the component exceeds the recommended weight for one individual to handle safely.
  
  **WARNING:** To reduce the risk of personal injury or damage to the equipment, observe local occupational health and safety requirements and guidelines for manually handling material.
Rack stability

Rack stability protects personnel and equipment.

**WARNING:** To reduce the risk of personal injury or damage to the equipment, be sure that:

- The leveling jacks are extended to the floor.
- The full weight of the rack rests on the leveling jacks.
- In single rack installations, the stabilizing feet are attached to the rack.
- In multiple rack installations, the racks are coupled.
- Only one rack component is extended at any time. A rack may become unstable if more than one rack component is extended for any reason.

Getting help

If you still have a question after reading this guide, contact an HP authorized service provider or access our web site: [http://www.hp.com](http://www.hp.com).

HP call centers use product and serial numbers to validate warranty entitlement. Most HP products can provide product number, serial number and firmware revision electronically through the use of supplied management or diagnostic utilities, eliminating the need to physically inspect or remove products from installed enclosures. To provide timely service you may be directed by HP to run these utilities to gather required entitlement information.

HP technical support

Telephone numbers for worldwide technical support are listed on the following HP web site: [http://www.hp.com/support/](http://www.hp.com/support/). From this web site, select the country of origin.

**Note:** For continuous quality improvement, calls may be recorded or monitored.

Be sure to have the following information available before calling:

- Technical support registration number (if applicable)
- Product serial numbers
- Product model names and numbers
- Applicable error messages
- Operating system type and revision level
- Detailed, specific questions

HP storage web site

The HP web site has the latest information on this product, as well as the latest drivers. Access storage at: [http://www.hp.com/country/us/eng/prodserv/storage.html](http://www.hp.com/country/us/eng/prodserv/storage.html). From this web site, select the appropriate product or solution.
**HP authorized reseller**

For the name of your nearest HP authorized reseller:

- In the United States, call 1-800-345-1518
- In Canada, call 1-800-263-5868
- Elsewhere, see the HP web site for locations and telephone numbers: [http://www.hp.com](http://www.hp.com).
Illustrated Parts Catalog

This chapter provides the illustrated parts breakdown and a spare parts list for the HP StorageWorks Modular Smart Array 1500 cs (MSA1500 cs). See Table 2 for information on referenced parts.
MSA1500 cs mechanical parts and system components exploded view

Figure 1: MSA1500 cs mechanical parts and system components exploded view

**Note:** The MSA1500 cs can support up to 96 SATA drives with the addition of 8 SATA expansion enclosures, or 56 SCSI drives with the addition of 4 SCSI expansion enclosures. The MSA1500 cs contains no internal drives.

Removal and Replacement Procedures

This chapter provides subassembly/module-level removal and replacement procedures for the MSA1500 cs. After completing all necessary removal and replacement procedures, run the Diagnostics software described in Chapter 3, Diagnostics to verify that all components operate properly.

---

**WARNING:** To reduce the risk of personal injury or damage to the equipment, observe all warnings and cautions throughout this chapter.

---

**WARNING:** To reduce the risk of personal injury or damage to the equipment, the installation of options other than hotplug power devices should be performed only by individuals who are qualified in servicing computer equipment and trained to deal with products capable of producing hazardous energy levels.

---

To service the MSA1500 cs, the following tools are recommended:

- 4-mm flat-blade screwdriver (for SCSI cables)
- #2 phillips screwdriver (for 2U chassis)
Preparation procedures

System power to the MSA1500 cs does not shut off completely with the power switch. The two positions of the front panel power switch should be considered as ON and STANDBY, rather than ON and OFF. The STANDBY position removes power from most of the electronics and the drives, but portions of the power supply and some internal circuitry remain active. To remove all power from the system, you must disconnect the power cord from the storage system. In systems with multiple power supplies, you must disconnect all the power cords to remove power completely from the system.

**WARNING:** To reduce the risk of electric shock or damage to the equipment, disconnect power from the storage system by unplugging all power cords from either the electrical outlet or the MSA1500 cs.

**Note:** Before removing any serviceable part, determine whether the part is hot-pluggable or non-hot-pluggable. Hot-pluggable devices in the MSA1500 cs include the fan modules, power supplies, I/O modules and the MSA1000 controllers.

**Hot-pluggable parts**

If the part is hot-pluggable, a power shutdown of the device in not required for replacement of the part. Hot-pluggable devices in the MSA1500 cs include the power supplies, fan modules, SCSI I/O modules, Fibre Channel I/O modules, and MSA1000 Controllers.

**WARNING:** Before replacing a hot-pluggable component ensure that steps have been taken to prevent loss of data.

**Non-hot-pluggable parts**

If the part is non-hot-pluggable, the MSA1500 cs must be powered down. Non-hot-pluggable parts include the 2U chassis, and the power switch.

**WARNING:** To reduce the risk of personal injury or damage to the equipment, the installation of options other than hot-plug power devices should be performed only by individuals who are qualified in servicing computer equipment and trained to deal with products capable of producing hazardous energy levels.
Powering down the MSA1500 cs

Before beginning any of the removal and replacement procedures for non-hot-pluggable devices, do the following:

1. Hold down the Power On/Standby switch for five seconds.

   **Note:** powering down the unit places the device in standby mode that disables the main power supply output and provides only auxiliary power (+5V) to the device.

2. Verify that the Power On/Standby switch power LED indicator is Green/Off and that the fans are off.
3. Disconnect all power cords from the AC outlets, and then from the device.

   **WARNING:** To reduce the risk of injury from electric shock, remove all power cords to completely disconnect power from the system.

4. Disconnect all external peripheral devices from the MSA1500 cs.

   **WARNING:** To reduce the risk of personal injury or damage to the equipment, observe local occupational health and safety requirements and guidelines for manually handling material.
Rack warnings

**WARNING:** To reduce the risk of personal injury or damage to the equipment:

- Observe local occupational safety requirements and guidelines for heavy equipment handling.
- Obtain adequate assistance to lift and stabilize the product during installation or removal.
- Remove all pluggable power supplies and modules to reduce the weight of the product.
- Always load the heaviest item first, and load the rack from the bottom up. This makes the rack “bottom-heavy” and helps prevent the rack from becoming unstable.
- Extend the leveling jacks to the floor.
- Rest the full weight of the rack on the leveling jacks.
- Attach the stabilizing feet to the rack if it is a single-rack installation.
- The racks are coupled in multiple-rack installations.
- Fully extend the bottom stabilizers on the equipment. Be sure that the equipment is properly supported/braced when installing options and boards.
- Be careful when sliding the unit into the rack. The slide rails could pinch your fingertips.
- Ensure that the rack is adequately stabilized before extending a component outside the rack. Extend only one component at a time. A rack may become unstable if more than one component is extended for any reason.
- Do not attempt to move a fully loaded equipment rack. Remove equipment from the rack before moving the rack.
- At least two people are needed to safely unload the rack from the pallet. An empty 42U rack weighs 115 kg (253 lb), is over 2.1 meters (7 ft) tall, and may become unstable when being moved on its casters. Do not stand in front of the rack as it rolls down the ramp from the pallet; handle it from the sides. Stabilize the device by keeping the unit on the rails.

**WARNING:** Because the rack allows stacking of computer components on a vertical rather than horizontal plane, ensure that precautions have been taken to provide for rack stability and safety. It is important to follow these precautions providing for rack stability and safety, and to protect both personnel and property. Heed all cautions and warnings throughout the installation instructions provided with the device.
Device warnings and precautions

**WARNING:** The installation of internal options and service of this product should be performed by individuals who are knowledgeable about the procedures, precautions, and hazards associated with equipment containing hazardous energy levels.

**WARNING:** To reduce the risk of electric shock or damage to the equipment:

- Allow the product to cool before removing covers and touching internal components.
- Do not disable the power cord grounding plug. The grounding plug is an important safety feature.
- Plug the power cord into a grounded (earthed) electrical outlet that is easily accessible at all times.
- Disconnect power from the device by unplugging the power cord from either the electrical outlet or the device.
- Do not use conductive tools that could bridge live parts.
- Remove all watches, rings, or loose jewelry when working in hot-plug areas of an energized device.
- Or-
  - The device should be installed in a controlled access location where only qualified personnel have access to the device.
  - Power down the equipment and disconnect power to all AC power cords before removing any access covers for non-hot-pluggable areas.
  - Do not replace non-hot-pluggable components while power is applied to the product. First, shut down the product and disconnect all AC power cords.
  - Do not exceed the level of repair specified in the procedures in the product documentation. All troubleshooting and repair procedures are detailed to allow only subassembly or module-level repair. Because of the complexity of the individual boards and subassemblies, do not attempt to make repairs at the component level or to make modifications to any printed wiring board. Improper repairs can create a safety hazard.
  - Verify that the AC power supply branch circuit that provides power to the rack is not overloaded. Not overloading AC power to the rack power supply circuit reduces the risk of personal injury, fire, or damage to the equipment. The total rack load should not exceed 80 percent of the branch circuit rating. Consult the electrical authority having jurisdiction over your facility wiring and installation requirements.

**Caution:** Protect the installed solution from power fluctuations and temporary interruptions with a regulating Uninterruptible Power Supply (UPS). This device protects the hardware from damage caused by power surges and voltage spikes, and keeps the system in operation during a power failure.
Connecting the power

It is strongly recommended to use the power cord that is shipped with your MSA1500 cs. If using a different power cord your power cord should be approved for use in your country. The power cord must be rated for the product and for the voltage and current marked on the electrical ratings label of the product. The voltage and current rating of the cord should be greater than the voltage and current rating marked on the product. In addition, the diameter of the wire must be a minimum of 1.02 mm² or 18 AWG. If you are using 18 AWG, your maximum length may be up to 3.65 meters.

A power cord should be routed so that it is not likely to be walked on or pinched by items placed upon it or against it. Particular attention should be paid to the plug, electrical outlet, and the point where the cord exits from the product.

After all hardware components are installed and the unit is in place, the power can be connected.

1. Plug the AC power cord into the MSA1500 cs. The power supply automatically senses the input voltage. It is not necessary to select the correct main voltage.

---

**WARNING:** To reduce the risk of electric shock or damage to the equipment:

- Do not disable the power cord’s grounding plug. The grounding plug is an important safety feature.
- Plug the power cord into a grounded (earthed) electrical outlet that is easily accessible at all times.
- Disconnect power from the storage system by unplugging all power cords from the storage system.

---

2. Plug the AC power cord into a nearby, grounded outlet.
3. Plug the second AC power cord into the redundant power supply.
4. Plug the second AC power cord into a grounded outlet nearby.
Applying power

Before applying power to the MSA1500 cs all components of the storage system must be installed and connected to the supported interconnect options.

The MSA1500 cs components must be powered up in the following order:

1. **Storage Enclosures**—Power on all storage expansion enclosures.
2. **MSA1500 cs**—Power the MSA1500 cs on with the power switch located in the far-right lower area of the front panel. After powering on, wait until the message “MSA1000 Startup Complete” appears on your display. This process may take up to two minutes.
3. **Server(s)**—Ensure that the servers that are attached to the MSA1500 cs are powered on.

**MSA1000 Controller**

**Verifying component failure**

Before replacing the controller, cache module, or batteries, use the following methods to verify the component failure.

*Note: Record any failure indicators for reference purposes.*

- Check the controller idle heartbeat LED 1. If the LED is not blinking, it indicates a failure.
- Check the controller fault LED 2. If the LED is on, it indicates a failure.

- Remove the controller, wait 10 seconds, and then reinsert it, ensuring that it is fully seated in the chassis. If this does not resolve the issue, continue with the replacement procedures.

Caution: Before replacing any component including those that are hot-pluggable, ensure that steps have been taken to minimize downtime and prevent loss of data.
Replacing the MSA1000 Controller

The following steps detail how to replace a failed MSA1000 Controller.

**Note:** Before replacing your controller, follow these guidelines: If your system is equipped with a single controller, and this controller fails, it is recommended that the old cache module be migrated to a new controller. This is done to complete the disk writes that may have been trapped in the controller’s cache. If an expand process is occurring, a dual controller system will transition into a non-redundant state. If a controller failure occurs during an expand process, it is required that the old cache module be migrated to the replacement controller to complete the expand process. If this is not done, the array contents will be invalid.

**Note:** The MSA1000 Controller is hot-pluggable and the unit does not need to be powered down in order to replace them.

1. Complete the preparation procedures. See the “Preparation procedures” on page 20 of this chapter.
2. Press the controller thumb latch and pull the latch handle toward you 1.
3. Remove the MSA1000 Controller by pulling it straight out of the chassis 2.

![Figure 3: Removing the MSA1000 Controller](image-url)
4. Insert the replacement controller into the chassis.
5. Push the controller in as far as it will go 1 and press the latch inward until it is flush against the front panel 2.

Figure 4: Installing the replacement controller
Replacing the MSA1000 Controller cache

**Caution:** It is important to follow these instructions when replacing components in the MSA1000. If the procedure is done improperly, it is possible to lose data or damage equipment. Refer to the “Preparation Procedures” section of this chapter for important information on using the proper procedures.

**Note:** If your system is equipped with a single controller, and you must replace the controller cache, you must power down the system first. If your system is equipped with two controllers, and you want to replace a failed cache module with another of the same size, you can replace the module while the system is running. If your system is equipped with two controllers, and you are replacing the cache module with a module of a different size, you must power down the system first, and then change the cache module on both controllers at the same time.

**Caution:** Before replacing any component including those that are hot-pluggable, ensure that steps have been taken to minimize downtime and prevent loss of data.

1. Complete the preparation procedures. See the “Preparation procedures” on page 20 of this chapter.

2. Press the thumb latch on the controller and pull the latch handle towards you. See “Removing the controller” on page 29.

3. Remove the MSA1000 Controller by pulling it straight out of the chassis.

![Figure 5: Removing the controller](image-url)
4. As illustrated in Figure 6, unlatch the controller cover clips 1 on the rear of the controller and then raise the cover 2.

**Note:** The controller in Figure 6 has been rotated so the side and rear of the controller are visible.

5. Simultaneously unlatch the clips that are holding the MSA1000 Controller cache in place 3.
6. Carefully pull the cache away from the controller board 4.

![Figure 6: Removing the cache module](image-url)
7. Install the new MSA1000 Controller cache by sliding the new MSA1000 Controller cache into the controller 1. Be sure the side latches are fully engaged 2. See Figure 7.

Figure 7: Installing the cache module

8. Push the controller in as far as it will go 1; press the latch inward until it is flush against the front panel 2. See Figure 8.

Figure 8: Installing the controller
Replacing the controller cache battery pack

**WARNING:** There is a risk of explosion, fire, or personal injury if the battery pack is replaced incorrectly or mistreated. To reduce the risk:

- Do not attempt to recharge the battery outside of the controller.
- Do not expose to water, or to temperatures higher than 60°C.
- Do not abuse, disassemble, crush, puncture, short external contacts, or dispose of in fire or water.
- Replace only with the spare designated for this product.
- Cache module battery disposal should comply with local regulations. Alternatively, return them by established parts return methods to Hewlett-Packard Corporation for disposal.

**Caution:** It is important to follow these instructions when replacing components in the MSA1000. If the procedure is done improperly, it is possible to lose data or damage equipment. Refer to “Preparation procedures” of this chapter for important information on using the proper procedures.

To remove the old NiMH battery pack:

1. Remove the MSA1000 Controller cache, as instructed in the previous section, “Replacing the MSA1000 Controller cache.”

2. Push down on the bottom clip of the battery pack, attached near the lower corner of the cache module.
   
   See Figure 9.

![Figure 9: Bottom clip on battery pack](image)
3. Swing the battery pack away from the cache module to about a 30-degree angle.

![Angling the battery pack](image1)

**Figure 10: Angling the battery pack**

4. Lift the pack upward to unhook the top of the battery pack.

![Removing the battery pack](image2)

**Figure 11: Removing the battery pack**

5. Repeat for the second battery on this cache module.

   Wait about 15 seconds after removing the old battery packs to allow the battery charge monitor to reset.
6. Install the new NiMH battery pack by hooking the top of the battery pack to the top of the cache module with the pack held at a 30-degree angle to the plane of the cache module board.

See Figure 12 for an illustration.

![Figure 12: Installing the battery pack](image)

7. After the pack is hooked in position, swing the pack downward making sure the bottom clip and two pegs line up with the holes in the cache module.

8. Make sure that the top hook 1 and bottom clip 2 on the battery pack are securely attached to the cache module.

![Figure 13: Securing the battery pack](image)

9. Installation of the new battery is complete.
Hot-plug power supply

The power supplies for the MSA1500 cs are hot-pluggable and the unit does not need to be powered down to replace one.

Replacing a power supply

Verifying component failure

Before replacing the power supply use the following methods to verify the component failure.

- Check the controller LCD for the error message listed in Table 4.
- The power supply indicator on the rear of the module is flashing amber.
- The system has power but the power supply indicator on the rear of the module is off.

Table 4: Power Supply LCD Error Message

<table>
<thead>
<tr>
<th>No.</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>409</td>
<td>STORAGE BOX #&lt;n&gt; POWER SUPPLY FAILED</td>
</tr>
</tbody>
</table>

Caution: Before replacing any component including those that are hot-pluggable, ensure that steps have been taken to minimize downtime and prevent loss of data. Removing a power supply significantly changes the airflow within the MSA1500 cs. To avoid possible overheating, always replace the power supply immediately. After removal of a power supply, the system will power down automatically if the internal temperature exceeds acceptable limits.

1. Complete the preparation procedures. See the “Preparation procedures” on page 20.
2. Disconnect the AC power cord from the failed power supply.
3. While pushing the power supply port-colored module latch 1, pull the power supply out of the enclosure 2.

Figure 14: Removing the power supply

4. Install the replacement supply by lifting up on the power supply module latch and pushing in the base until the assembly is fully seated in the enclosure.

Figure 15: Installing the replacement power supply
Verifying the replacement

After replacing the failed power supply verify that:

- Check the controller LCD for the message listed in Table 5.

Table 5: Power Supply LCD Verification Message

<table>
<thead>
<tr>
<th>No.</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>408</td>
<td>STORAGE BOX #&lt;n&gt; POWER SUPPLY OK</td>
</tr>
</tbody>
</table>

- The power supply indicator on the rear of the module is solid green.

Hot-plug fan module

The fan modules for the MSA1500 cs are hot-pluggable and the unit does not need to be powered down to replace one.

Replacing a fan module

Verifying component failure

Before replacing the fan module use the following methods to verify the component failure.

- Check the controller LCD for the error message listed in Table 6.

Table 6: Fan Module LCD Error Message

<table>
<thead>
<tr>
<th>No.</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>401</td>
<td>STORAGE BOX #&lt;n&gt; FAN FAILED</td>
</tr>
</tbody>
</table>

- The system fault indicator on the enclosure is amber.
- The fan module indicator on the rear of the module is flashing amber.

**Caution:** Before replacing any component including those that are hot-pluggable, ensure that steps have been taken to minimize downtime and prevent loss of data. Removing a fan module significantly changes the cooling within the enclosure. To avoid possible overheating, always replace the fan module immediately. After removal of a fan module, the system will power down automatically if the internal temperature exceeds acceptable limits.

To replace the fan module:

1. Complete the preparation procedures. See the “Preparation procedures” on page 20.
2. Lift the port-colored fan module latch ① and pull the fan module out of the enclosure ②.

![Figure 16: Removing the fan module](image1)

To install a fan module, slide it into the bay until it clicks into place.

![Figure 17: Installing the fan module](image2)
Verifying the Replacement

After replacing the failed fan module verify that:

- The controller LCD for the message listed in Table 7.

Table 7: Fan Module LCD Verification Message

<table>
<thead>
<tr>
<th>No.</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>400</td>
<td>STORAGE BOX #&lt;n&gt; FAN OK</td>
</tr>
</tbody>
</table>

- The system fault indicator on the enclosure is off.
- The heartbeat LED is flashing green.
- The fan module indicator on the rear of the module is solid green.

SCSI I/O module

Replacing a SCSI I/O module

Verifying component failure

Before replacing the SCSI I/O module use the following methods to verify the component failure.

- Check the controller LCD for one of the error messages listed in Table 8.

Table 8: SCSI I/O LCD Error Messages

<table>
<thead>
<tr>
<th>No.</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>23</td>
<td>SCSI SUBSYSTEM HARDWARE FAILURE</td>
</tr>
<tr>
<td>412</td>
<td>STORAGE BOX #&lt;n&gt; EMU NOT RESPONDING</td>
</tr>
</tbody>
</table>

- The status LED is not illuminated or is flashing amber.

**Caution:** Before replacing any component including those that are hot-pluggable, ensure that steps have been taken to minimize downtime and prevent loss of data. Removing a SCSI I/O module significantly changes the airflow within the enclosure. To avoid possible overheating, always replace the SCSI I/O module as soon as possible. If the internal temperature exceeds acceptable limits.

1. Complete the preparation procedures. See the “Preparation procedures” on page 20.

**Note:** Before removing the SCSI I/O module, label all cables. This ensures their reconnection in the correct configuration.

2. Disconnect all SCSI cables from the SCSI I/O module.
3. Lift the port-colored SCSI I/O module latch 1 and pull the SCSI I/O module out of the enclosure 2.

![Figure 18: Removing the SCSI I/O module](image)

4. Slide the SCSI I/O module into the bay until it clicks into place.

![Figure 19: Installing the SCSI I/O module](image)

5. Reconnect all SCSI cables.

Note: Make sure that all of the SCSI connectors are fastened tightly.
Verifying the replacement

After replacing the failed SCSI I/O module verify that:
- No error messages are displayed on the controller LCD.
- The status LED is solid green.

Returning the failed component.

Fibre Channel I/O module

Replacing a Fibre Channel I/O module

Verifying component failure

Before replacing the Fibre Channel I/O module use the following methods to verify the component failure.
- Check the controller LCD for one of the error messages listed in Table 9.
- The status LED on the rear of the Fibre Channel I/O module is not illuminated or is flashing amber.
- The 1-GB LED is flashing amber.
- The 2-GB LED is flashing amber.

Caution: Before replacing any component including those that are hot-pluggable, ensure that steps have been taken to minimize downtime and prevent loss of data. Removing an Fibre Channel I/O module significantly changes the airflow within the enclosure. To avoid possible overheating, always replace the I/O module as soon as possible.

1. Complete the preparation procedures. See the “Preparation procedures” on page 20.

Caution: Use appropriate precautions when handling Fibre Channel cables:
- Touching the end of a Fibre Channel cable will either damage the cable or cause performance problems, including intermittent difficulties accessing the storage.
- Whenever a Fibre Channel cable is not connected, replace the protective covers on the ends of the cable.
- Make certain that the Fibre Channel cables are installed and supported so that no excess weight is placed on the connectors. This prevents damage to the connector and cable. Excess cable should be loosely coiled and tied out of the way, being careful not to coil the cable in a tight loop with a bend radius of less than 3 inches (7.62 cm).

2. Disconnect the fibre cable from the Fibre Channel I/O module.

Table 9: Fibre Channel I/O Module LCD Error Messages

<table>
<thead>
<tr>
<th>No.</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>515</td>
<td>FIBRE DEVICE HARDWARE FAILURE</td>
</tr>
<tr>
<td>516</td>
<td>FIBRE SUBSYSTEM LINK FAILURE</td>
</tr>
</tbody>
</table>
3. Lift the port-colored Fibre Channel I/O module latch 1 and pull the I/O module out of the enclosure 2.

Figure 20: Removing the Fibre Channel I/O module

4. Slide it into the bay until the module clicks into place.

Figure 21: Installing the Fibre Channel I/O module

5. Move the SFP transceiver to the new Fibre Channel I/O module

Note: For instructions on replacing the SFP transceiver see “Replacing a SFP transceiver” on page 43.
Verifying the replacement

After replacing the failed Fibre Channel I/O module verify that:

- No error messages are displayed on the LCD.
- The status LED is solid green.
- The 1-GB LED is solid green.
- The 1-GB LED is solid green.

2-Gb Small Form Factor Pluggable (SFP) transceiver

Replacing a SFP transceiver

If a transceiver fails, follow this procedure to replace the failed transceiver. It is not necessary to power down the system.

**Caution:** Before replacing a hot-pluggable component ensure that steps have been taken to prevent loss of data.

Laser precautions

**WARNING:** To reduce the risk of injury from laser radiation or damage to the equipment, observe the following precautions:

- Do not open any panels, operate controls, make adjustments, or perform procedures to a laser device other than those specified herein.
- Do not stare into the laser beam when panels are open.

1. Press the release clip on the bottom of the cable connector to remove the Fibre Channel I/O cable from the back of the failed transceiver.
2. Pull the release tab on the transceiver and pull the transceiver straight out of the device.

Figure 22: Removing the failed SFP
3. With the plastic tab facing to the right, insert the replacement transceiver straight into the device.

![Figure 23: Installing a new SFP](image)

4. Remove the dust cover from the SFP.

![Figure 24: Removing the dust cover from the SFP](image)

5. Insert the Fibre Channel I/O cable with the clip side to the left into the transceiver. The cable should snap into place.

---

**Caution:** To reduce the risk of damage to the equipment, do not use excessive force when inserting the transceiver.
Replacing the power switch assembly

The power switch assembly is not hot-pluggable and the MSA1500 cs must be powered down and disconnected before the component can be replaced. For instruction on powering down the MSA1500 cs, refer to “Powering down the MSA1500 cs” on page 21.

To replace the power switch assembly:
1. Power down the MSA1500 cs.

   **Note:** Before disconnecting any cables, label them so that they can be reconnected to the same connectors when the power switch assembly replacement is complete.

2. Disconnect the power cables from the MSA1500 cs.
3. Disconnect the fibre cable from the MSA1500 cs.
4. Disconnect the SCSI cables from the MSA1500 cs.
5. Remove the MSA1500CS from the rack.
6. Remove the bezel 1 as shown in Figure 25.
7. Remove the eight screws securing the top cover to the chassis 2.

   **Caution:** Before opening the MSA1500 cs, review the electrostatic discharge information contained in Appendix B, Electrostatic Discharge.

8. Lift the front of the top cover and remove it from the chassis 3, as shown in Figure 25.

---

**Figure 25: Removing the top cover**
9. Unplug the power switch cable from the midplane, as shown in Figure 26.

![Figure 26: Unplugging the power switch cable](image)

10. Press the release tab on the left side of the power switch assembly ① and then push the power switch assembly back to remove it ②, as shown in Figure 27.

![Figure 27: Removing the power switch assembly](image)
11. Insert the new power switch assembly into the front panel and push into its seated position, as shown in Figure 28.

![Figure 28: Reseating the power switch assembly](image)

12. Connect the end of the power switch cable to the midplane as shown in Figure 29.

![Figure 29: Connecting the power switch cable](image)

13. Replace the top cover and fasten using the screws that were removed in step 7.
14. Replace the bezel.
15. Reinstall the MSA1500 cs in the rack.
16. Reconnect the SCSI, fiber, and power cables.
17. Power on the MSA1500 cs.
Verifying the replacement

After replacing the failed power switch assembly verify that the power LED is illuminated.

Replacing a MSA1500 cs 2U chassis

In the event of a chassis failure, a new chassis must be ordered. All original component parts of the MSA1500 cs can be reinstalled to their respective locations in the new chassis. The MSA1500 cs must be powered down and disconnected before the chassis can be replaced. For instruction on powering down the MSA1500 cs, refer to “Powering down the MSA1500 cs” on page 21.

Note: Before disconnecting any cables and components, label them so that they can reinstalled in the same position when the chassis replacement is complete.

The parts that will be removed and then reinstalled include:

- MSA1000 Controllers
  For instructions on reinstalling the MSA1000 Controller, refer to “Replacing the MSA1000 Controller” on page 27.
- Hot-pluggable power supplies
  For instructions on reinstalling the power supplies, refer to “Replacing a power supply” on page 35.
- Fan modules
  For instructions on reinstalling the fan modules, refer to “Replacing a fan module” on page 37.
- SCSI I/O modules
  For instructions on reinstalling the SCSI I/O modules, refer to “Replacing a SCSI I/O module” on page 39.
- Fibre Channel I/O modules
  For instructions on reinstalling the Fibre Channel I/O modules, refer to “Replacing a Fibre Channel I/O module” on page 41.
- Slot and controller blanks

When finished, write the serial number, shown on the original chassis, on the label of the replacement chassis, located in the area shown in Figure 30.
Fibre Channel I/O cables

Multi-Mode Fibre Channel I/O cable

Multi-mode Fibre Channel I/O cables are capable of supporting distances of 2 m to 500 m (6.56168 ft to 1640.42 ft) at 1-Gb and 300 m at 2-Gb. These cables are for use with Short-wave transceivers only. To ease the installation of the HP StorageWorks MSA1500 cs, multi-mode Fibre Channel I/O cable option kits are available from HP. Each kit contains a multi-mode Fibre Channel I/O cable with a connector attached to each end.

The available 1-Gb to 2-Gb connection cable options are:

- 2-meter multi-mode Fibre Channel I/O cable option kit (part number 221691-B21)
- 5-meter multi-mode Fibre Channel I/O cable option kit (part number 221691-B22)
- 15-meter multi-mode Fibre Channel I/O cable option kit (part number 221691-B23)

Available 2-Gb to 2-Gb connection cable options are:

- 2-meter multi-mode Fibre Channel I/O cable option kit (part number 221692-B21)
- 5-meter multi-mode Fibre Channel I/O cable option kit (part number 221692-B22)
- 15-meter multi-mode Fibre Channel I/O cable option kit (part number 221692-B23)

To customize your system with multi-mode Fibre Channel I/O cable at distances greater than 15 meters, contact an independent Fibre Channel I/O cable supplier.

If you use an existing 62.5-micron cable, you must obtain a 62.5-micron jumper from an independent source. A 50-micron cable cannot be spliced with a 62.5-micron cable.
Diagnostics

Overview

This chapter describes software and firmware diagnostic tools available for the HP StorageWorks MSA1500 cs.
**MSA1000 Controller indicators**

During normal runtime, the MSA1000 Controller has 16 indicators that indicate activity or malfunction of the controller. They are labeled 1-16, as shown in the following figure. The table that follows describes the purpose and function of each indicator.

![MSA1000 Controller indicators](image)

**Figure 31: MSA1000 Controller indicators**

**Table 10: MSA1000 Controller Indicator Descriptions**

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Drive failure</td>
<td>ON = A configured hard drive has failed in the array</td>
</tr>
</tbody>
</table>
| 2         | Cache activity | ON = Cache active  
            OFF = No cache activity  
            Blinking = Cache transfer pending |
| 3         | SCSI Bus 1 active | ON = Indicates requests are outstanding on the second SCSI bus |
| 4         | SCSI Bus 0 active | ON = Indicates requests are outstanding on the first SCSI bus |
| 5         | Logical I/O active | ON = Currently processing logical requests from the Host Adapter |
| 6         | Direct Memory Access (DMA) active | ON = DMA transfers are active |
| 7         | Active/Standby | ON=Controller is active  
             OFF=Controller is in standby |
| 8         | Idle heartbeat | Indicates the array controller is idle and functioning |
| 9-10      | Busy status | ON = Indicates this array controller is idle  
            OFF = Indicates this array controller is operating at full capacity |
| 11-16     | Fibre Channel IDs | |
MSA1000 Controller display

Each array controller in a MSA1500 cs contains an integrated Liquid Crystal Display (LCD). This module is used for displaying informational and error messages, showing the status of the module, and for providing user input when required. Traditional Power-On Self-Test (POST) messages issued by PCI-based array controllers have been combined with runtime event notification messages to create a new set of controller display messages.

The display module consists of the following components:
- A two line, twenty column display text display window
- Four navigation buttons arranged in a circular “pie” shape
- Two status indicator lights

---

</tr>
</tbody>
</table>
Controller display messages

The display module is capable of holding up to 100 messages. After this maximum size is reached, older messages are removed to make room for newer ones. Messages can be of three types: error, informational, and user input.

The display message may specify a box number. The following box numbers are defined.

- Box 1 is the MSA1500 cs chassis.
- Box 2 is the storage enclosure attached to SCSI port A of the MSA1500 cs.
- Box 3 is the storage enclosure attached to SCSI port B of the MSA1500 cs.

Error messages

Error messages indicate that a problem has occurred and may require user action to correct it. A complete list of possible messages and their meanings is contained in this chapter.

An amber indicator to the left of the LCD display is turned on when an error message is currently displayed. This indicator is turned on if an error message was sent to the display module but has not been viewed because non-error type messages were sent to the display module afterwards. By scrolling backward and viewing all error messages, the indicator will reset and light when currently on an error message.

Informational messages

Informational messages indicate non-critical changes in the system that are provided as feedback to the user. A complete list of possible messages and their meanings is contained in this chapter.

The amber indicator to the left of the LCD display is off whenever an informational message is currently being viewed unless an unviewed error message was previously sent to the display module. By scrolling backward and viewing all error messages, the indicator will return to only lighting up when currently on an error message.

User input messages

User input messages indicate that the system has encountered a situation that allows user input. The user can select from a number of choices. If the user does not select one of the choices in a set amount of time, the system will select the default setting. These user input messages will only occur during system power on and not during run time. A complete list of possible messages and their meanings is contained in this chapter.

The amber indicator to the left of the display text display window will blink on and off when a user input message is currently being viewed and is available for input. If the user has not provided input within the time-out period, the message will remain but the indicator will stop blinking.

Scrolling

Older messages can be viewed by scrolling backward using the \textit{up} navigation button (with the up arrow on it). Messages that are more recent can be viewed by scrolling forward using the \textit{down} navigation button (with the down arrow on it). The last message can be viewed by pressing the \textit{left} navigation button. When a new message is sent to the LCD, the display shows that message and ignores any previous scrolling position. This new message is now the most recent message available.
Deleting messages

The currently displayed message can be deleted from the display module by pressing the left navigation button and the right navigation button at the same time.

Redundancy link light

There is a green indicator to the left of the LCD display that is lit when two array controllers are inserted into the MSA1500 cs with controller redundancy enabled. The indicator is not lit if only one array controller is inserted or if the array controllers are not redundant due to some type of failure.

Note: You must have redundant cables connected to enable redundancy.
LCD Message Descriptions

The following table contains the defined messages and their components.

Table 11: LCD Message Descriptions

<table>
<thead>
<tr>
<th>Message</th>
<th>Type</th>

</tr>
</tbody>
</table>
## 52 Redundancy
### Failed PCI Bus Error

Error While either attempting to enter redundant mode or already operating in redundant mode, one of the array controllers encountered a PCI bus error on the communication channel used between the two array controllers. Redundancy is disabled at this time.

If the MSA1000 is currently involved in host I/O, remove the standby array controller, wait 10 seconds, and then reinsert it ensuring that it is fully seated in the chassis.

If this does not resolve the issue then wait until down-time is available. Power off the MSA1500 cs, remove both array controllers, and reinsert them ensuring they are fully seated in the chassis.

Should the issue persist contact HP support.

### 53 Redundancy
### Failed No Second Controller

Error While operating in redundant mode, one of the array controllers was removed. Redundancy is disabled at this time.

Reinsert the missing array controller ensuring that it is fully seated in the chassis.

### 54 Redundancy
### Failed Cache Dimms Mismatch

Error The cache memory modules on two different controllers are not the same size. All cache memory modules must be the same size for redundancy to operate.

Remove the array controller that has been halted, replace the cache modules with the appropriately sized ones, wait 10 seconds, and then reinsert the array controller ensuring that it is fully seated in the chassis.

### 60 No Cache Module Found

Error The array controller requires at least one cache module in order to operate. Either there is not one present or it has failed.

Remove the failed array controller, either add a cache module or replace the failed one, wait 10 seconds, and then reinsert it ensuring that it is fully seated in the chassis.

Should the issue persist contact HP support.

### 61 Dual Cache Module Size Mismatch

Error The array controller has two cache modules attached but they are of different sizes. Both cache modules must be the same size.

Remove the failed array controller, replace one of the cache modules with a different one that is of the correct size, wait 10 seconds, and then reinsert it, ensuring that it is fully seated in the chassis.

### 62 Cache Module #<n> <n> MB

Informational Displays the size of the cache module inserted into the respective cache module slot.

<tbody>
<tr>
<td>63 VALID CACHE DATA FOUND AT POWER-UP</td>
<td>Informational</td>
<td>Valid host data was found in the battery backed cache memory at power up. This data has been flushed to the drives.</td>
<td></td>
</tr>
<tr>
<td>64 CACHE DATA LOST BATTERY DEAD</td>
<td>Error</td>
<td>The battery on the cache memory was no longer charged. If there was data in the cache memory then it has been lost.</td>
<td></td>
</tr>
<tr>
<td>65 CACHE HARDWARE ENABLED</td>
<td>Informational</td>
<td>The cache hardware had been temporarily disabled but is now enabled again. This may have been due to insufficient charge on the batteries that have now charged up to capacity.</td>
<td></td>
</tr>
<tr>
<td>66 CACHE HARDWARE FAILED AND DISABLED</td>
<td>Error</td>
<td>The cache memory has experienced a hardware failure.</td>
<td>If the failure has occurred on the standby array controller, then remove the standby array controller, replace the cache modules, wait 10 seconds, and then reinsert the array controller insuring that it is fully seated in the chassis. If the failure has occurred on the active array controller, then wait until downtime is available. Power off the MSA1500 cs, remove the array controller, replace the cache modules, and reinsert the array controller insuring it is fully seated in the chassis. Should the issue persist contact HP support</td>
</tr>
<tr>
<td>67 CACHE HARDWARE TEMPORARILY DISABLED</td>
<td>Informational</td>
<td>The cache memory hardware has temporarily been disabled typically because either the battery is not charged up or a capacity expansion operation is occurring. The cache will automatically be enabled once the condition has been corrected.</td>
<td></td>
</tr>
<tr>
<td>68 OBSOLETE CACHE DATA DELETED</td>
<td>Informational</td>
<td>Old data that no longer belongs to any current configured volumes was found in the cache memory at power up. This data has been deleted. This typically happens if cache modules are moved between array controllers.</td>
<td></td>
</tr>
</tbody>
</table>

<tbody>
<tr>
<td>69 CACHE BATTERIES LOW, RECHARGING</td>
<td>Informational</td>
<td>The batteries on the cache module are low and are being recharged.</td>
<td></td>
</tr>
<tr>
<td>70 CACHE DISABLED NO CONFIGURATION</td>
<td>Informational</td>
<td>The cache has not been configured and therefore is disabled. The cache can be configured by using the Array Configuration Utility (ACU).</td>
<td></td>
</tr>
<tr>
<td>71 SYSTEM HALTED FOR CACHE ERROR</td>
<td>Error</td>
<td>This message is generated if the user chooses to ignore a critical cache error condition. It is always preceded by message #72 (although message #72 is removed from the LCD display once it has accepted user input).</td>
<td>The no option will cause the array controller to halt itself, providing the user an opportunity to resolve the issue. Selecting the yes option will result in the cache data being erased. Operation of the array controller will continue normally.</td>
</tr>
</tbody>
</table>
User Input During power up, data was found in the cache that could not be flushed to the drives. The reason is either because the data does not belong to this array controller (the cache board was moved from a different array controller) or the cache data is partial (the rest of the data is in another cache board that was removed from the array controller). This error could occur if cache boards are moved improperly.

The no option will cause the array controller to halt itself, providing the user an opportunity to resolve the issue. Selecting the yes option will result in the cache data being erased. Operation of the array controller will continue normally.

Error 1.1 and 1.2: There is only one cache board in the array controller at present but it was previously configured with a second cache board that is now missing (dual cache module configuration). Error 2.1 and 2.2: A second cache board that contained valid data was removed from its original array controller and added to this array controller (dual cache module configuration). Error 2.3: A cache board that contained valid data was removed from its original array controller and added to this array controller (single cache module configuration). Return all cache boards to their original array controllers. Power up the systems without allowing any host I/O and wait for the cache data to be written to the drives. This will take a few minutes after the systems have finished the power on sequence. The systems can be powered off and cache boards moved to their new locations.

</table>
Recovery ROM and ROM cloning

Recovery ROM

Each MSA1000 Controller contains ROM (Read-Only Memory), which holds the firmware that operates the controller. The Recovery ROM feature stores two complete firmware images in the ROM: one active image and one backup image. When the controller is powering up, it checks both firmware images to ensure they are valid. If either is not, the valid image will be copied on top of the invalid image to correct it. This is referred to as auto-flashing. All of this functionality is done automatically by the controller and does not require any user intervention.

ROM cloning

In order for a MSA1500 cs to operate in a redundant controller configuration, it must contain two controllers that are executing the same version of firmware. During power up (or if an optional controller is hot-plugged while the MSA1500 cs is already operating) the firmware versions on both controllers are compared. If they are not the same, then the ROM Cloning feature will attempt to copy one version of firmware onto the other controller. After the copy has been completed, the controller that was modified will be automatically reset. Once the reset controller has powered up the two controllers should then start redundant operation. All of this functionality is done automatically by the controllers and does not require any user intervention. On initial power up, the controller in the right slot is considered the primary controller and the version of firmware on that controller is cloned. If a failed controller is replaced, the controller still in operation is considered the primary controller and the version on that controller is cloned.

There is the possibility that a specific version of firmware may not be compatible with certain hardware revisions of a controller. In this scenario, the most recent firmware version that is compatible with both controllers will be copied to the controller with the incompatible firmware version. However, if the controller that is updated is already operating and processing I/O, then it will not be reset. The MSA1500 cs will not enter redundant operation and an appropriate message will be shown on the display. After the MSA1500 cs has been shutdown and powered back on, the controllers will then be able to enter redundant operation. On a subsequent power cycle, both controllers will enter redundant mode.
Connectors and Indicators

Overview
This chapter provides figures and tables showing front and rear views and the locations of connectors and indicators on various parts of the HP StorageWorks MSA1500 cs.

Front and rear views
This section contains figures and information about the front and rear views of the MSA1500 cs.
Front view

The front view is displayed in Figure 33.

![Front view diagram]

Indicators

The MSA1500 cs is equipped with a series of indicators. The following sections list the indicators.

Interpreting component indicators

If the fault indicator on any of the MSA1500 cs components is amber, determine the reason for this alert by examining the component indicators to see if any indicates a fault.

Enclosure status indicators

The Enclosure Status indicators are found on the MSA1500 cs, as shown in Figure 37.

![Enclosure status indicators](image)

<td>Power off</td>
</tr>
</tbody>
</table>
**Note:** The system power in the MSA1500 cs does not shut off completely with the power switch. STANDBY removes power from most of the electronics and the drives, but portions of the power supply and some internal circuitry remain active. To remove the power completely, disconnect all power cords from the equipment.

### Power supply

The power supply uses a single bi-color LED to indicate status. This LED can be illuminated with either a green or amber color. The green indicator on the power supply assembly is on when the power supply is operational. When the power supply experiences a fault, the power supply indicator turns amber. If the power supply indicator is off, AC power is not present.

![Figure 38: Power supply indicators](image)

</thead>
<tbody>
<tr>
<td>1</td>
<td>Solid green/off</td>
<td>Power on/power off</td>
</tr>
<tr>
<td>2</td>
<td>Flashing amber</td>
<td>Fault</td>
</tr>
</tbody>
</table>
Fan module

The fan modules cool the enclosure by circulating air through the enclosure and elements. The rate at which air moves (the air flow) determines the amount of cooling.

The fan module uses a single bi-color LED to indicate status. This LED can be illuminated with either a green or amber color. The green indicator on the fan module assembly is on when the fan module is operational. When the fan module experiences a fault, the fan module indicator turns amber.

![Fan module indicators diagram](image)

</tr>
<tr>
<td>2</td>
<td>SCSI port A</td>
<td>Flashing green</td>
<td>Activity</td>
</tr>
</tbody>
</table>
Fibre Channel I/O module

The Fibre Channel I/O module three bi-color LEDs to indicate status. These LEDs can be illuminated with either a green or amber color. Figure 41 and Table 20 describe the locations and meanings of the indicators.

Two flashing amber lights indicate that the controller is not present.

![Figure 41: Fibre Channel I/O module indicators](image)

**MSA1000 Controller indicators**

During normal runtime, the MSA1000 Controller has 16 indicators that indicate activity or malfunction of the controller. They are labeled 1-16. Figure 42 and Table 21 describe the purpose and function of each indicator.

![MSA1000 Controller indicators](image)

Regulatory Compliance Notices

Regulatory Compliance identification numbers

For the purpose of regulatory compliance certifications and identification, your HP StorageWorks MSA1000 is assigned an HP Series number. The Storage System Series number can be found on the product label, along with the required approval markings and information. The product label is located on the right side of the chassis. When requesting certification information for this product, always refer to this Series number. This Series number should not be confused with the marketing name or model number for your Storage System.

Federal Communications Commission notice

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at personal expense.

Modifications

The FCC requires the user to be notified that any changes or modifications made to this device that are not expressly approved by Hewlett-Packard Company may void the user's authority to operate the equipment.

Cables

Connections to this device must be made with shielded cables with metallic RFI/EMI connector hoods in order to comply with FCC Rules and Regulations.

Canadian notice (Avis Canadien)

This Class A digital apparatus meets all requirements of the Canadian Interference-Causing Equipment Regulations.

Cet appareil numérique de la classe A respecte toutes les exigences du Règlement sur le matériel brouilleur du Canada.
European Union notice

Products with the CE Marking comply with both the EMC Directive (89/336/EEC) and the Low Voltage Directive (73/23/EEC) issued by the Commission of the European Community. Compliance with these directives implies conformity to the following European Norms (in brackets are the equivalent international standards):

- EN55022 (CISPR 22) - Electromagnetic Interference
- EN50082-1 (IEC801-2, IEC801-3, IEC801-4) - Electromagnetic Immunity
- EN60950 (IEC950) - Product Safety

Japanese notice

ご使用になっている装置にVCCIマークが付いていましたら、次の説明文をお読み下さい。

この装置は、情報処理装置等電波障害自主規制協議会（VCCI）の基準に基づくクラスB情報技術装置です。この装置は、家庭環境で使用することを目的としていますが、この装置がラジオやテレビジョン受信機に近接して使用されると、受信障害を引き起こすことがあります。

取扱説明書に従って正しい取り扱いをして下さい。

VCCIマークが付いていない場合には、次の点にご注意下さい。

この装置は、情報処理装置等電波障害自主規制協議会（VCCI）の基準に基づくクラスA情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。
BSMI notice

警告使用者：

這是甲類的資訊產品，在居住的環境中使用時，可能
會造成射頻干擾，在這種情況下，使用者會被要求採
取某些適當的對策。

Laser compliance

The SFP Module contains a laser diode of either gallium aluminum arsenide (GaALAs) emitting in the wavelength range of 770-860 nm, or indium gallium arsenide phosphide (InGaAsP) emitting in the wavelength range of 1270-1355 nm. All HP systems equipped with a laser device comply with safety standards, including International Electrotechnical Commission (IEC) 825. With specific regard to the laser, the equipment complies with laser product performance standards set by government agencies as a Class 1 laser product. The product does not emit hazardous laser radiation.

**WARNING:** Use of controls or adjustments or performance of procedures other than those specified herein or in the laser product’s installation guide may result in hazardous radiation exposure. To reduce the risk of exposure to hazardous radiation:

- Do not try to open the unit enclosure. There are no user-serviceable components inside.
- Do not operate controls, make adjustments, or perform procedures to the laser device other than those specified herein.
- Allow only HP Authorized Service technicians to repair the unit.

The Center for Devices and Radiological Health (CDRH) of the U.S. Food and Drug Administration implemented regulations for laser products on August 2, 1976. These regulations apply to laser products manufactured from August 1, 1976. Compliance is mandatory for products marketed in the United States. This device is classified as a Class 1 laser product as defined by IEC 825.

This indicates that the product is classified as a CLASS 1 LASER PRODUCT.
Battery replacement notice

Your MSA1000 is provided with Nickel Metal Hydride batteries. There is a danger of explosion and risk of personal injury if the array is incorrectly replaced or mistreated. Replace only with the HP spare designated for this product. For more information about battery replacement or proper disposal, contact your HP Authorized Reseller or your Authorized Service Provider.

**WARNING:** Your Accelerator Array contains Nickel Metal Hydride batteries. There is risk of fire and burns if the battery pack is not handled properly. To reduce the risk of personal injury:
- Do not attempt to recharge the battery.
- Do not expose to temperatures higher than 60° C.
- Do not disassemble, crush, puncture, short external contacts, or dispose of in fire or water.
- Replace only with HP spare designated for this product.

**Caution:** Batteries, battery packs, and accumulators should not be disposed of together with the general household waste. In order to forward them to recycling or proper disposal, please use the public collection system or return them to HP, your authorized HP Partners, or their agents.
Electrostatic Discharge

To prevent damage to the system, be aware of the precautions you need to follow when setting up the system or handling parts. A discharge of static electricity from a finger or other conductor may damage system boards or other static-sensitive devices. This type of damage may reduce the life expectancy of the device.

To prevent electrostatic damage, observe the following precautions:

■ Avoid hand contact by transporting and storing products in static-safe containers.
■ Keep electrostatic-sensitive parts in their containers until they arrive at static-free workstations.
■ Place parts on a grounded surface before removing them from their containers.
■ Avoid touching pins, leads, or circuitry.
■ Always make sure you are properly grounded when touching a static-sensitive component or assembly.
Grounding methods

There are several methods for grounding. Use one or more of the following methods when handling or installing electrostatic-sensitive parts:

- Use a wrist strap connected by a ground cord to a grounded workstation or computer chassis. Wrist straps are flexible straps with a minimum of 1 megohm ± 10 percent resistance in the ground cords. To provide proper ground, wear the strap snug against the skin.
- Use heel straps, toe straps, or boot straps at standing workstations. Wear the straps on both feet when standing on conductive floors or dissipating floor mats.
- Use conductive field service tools.
- Use a portable field service kit with a folding static-dissipating work mat.

If you do not have any of the suggested equipment for proper grounding, have an Authorized HP Reseller install the part.

Note: For more information on static electricity, or assistance with product installation, contact your HP Authorized Reseller.
This chapter provides operating and performance specifications for the HP StorageWorks MSA1500 cs. The sections in this chapter are:

- MSA1500 cs chassis
- Memory
- Power supply
- SCSI I/O module
- Fibre Channel I/O module
- Fan module

**Note:** For information on all supported components and their part numbers, see Chapter 1, "Illustrated Parts Catalog."
