Index
About the digital sender

The HP 9200C Digital Sender connects directly to your network and uses the included HP Digital Sending Software (HP DSS) program to convert black-and-white and color documents, drawings, and photographs into an electronic form and then distribute them directly to several kinds of destinations.

- **E-mail**—Scan a document and send it to one or more e-mail recipients in the form of a .PDF, .JPEG, .TIFF, or .MTIFF file.
- **Secondary (secure) E-mail**—Send a document by using a secure third-party e-mail solution.
- **Fax**—Scan a document and send it to a local area network (LAN) fax, Internet fax, or Windows® 2000 fax destination. (The device does not have analog fax capability.)
- **Workflow**—Scan a document and save it to a network folder or file transfer protocol (FTP) site along with additional information about the document. A third-party software program can then retrieve and decipher the information, and perform the appropriate operation on the scanned image. A printer can also be set up as a workflow destination, allowing scanned documents to be printed.
- **Network Folder**—Scan a document and send it to a folder on the network.

The digital sender includes a flatbed scanner as well as an automatic document feeder (ADF) that can accept up to 50 pages.

The digital sender supports network authentication, allowing you to require users to log in before they can use the digital-sending options. It can also make use of Lightweight Directory Access Protocol (LDAP) to find and use e-mail addresses on directory servers that are located elsewhere on a network.

Installing the device is simply a matter of connecting it to your network, installing the HP DSS program that comes with the device, and configuring the digital-sending features. The digital sender operates as a standalone unit on the network and does not require network privileges for administration.
Features

The digital sender includes the following features:

- **Digital sending**—Send scanned files to e-mail addresses, fax destinations, network folders, and workflow folders. Digital-sending functions are carried out by the HP Digital Sending Software (HP DSS), which is included with the device.

- **ADF**—The legal-size ADF accepts up to 50 pages, and includes built-in duplexing for scanning both sides of a double-sided document.

- **Interactive touchscreen control panel**—Intuitive onscreen menus and wizards help you to complete digital-sending tasks.

- **Flatbed scanner**—The letter/A4-size scanner can scan in both black-and-white and color, with the ability to scan up to 1 mm (0.04 inch) from the paper edge.

- **Memory**—The device comes standard with 128 megabytes (MB) of random access memory (RAM).

- **Hard disk**—The device includes a 20-gigabyte (GB) internal hard drive for storing documents and settings.

- **Connectivity**—The device provides a 10/100Base-T port and an enhanced input/output (EIO) expansion slot for connectivity.

- **HP Jetdirect Inside**—An HP Jetdirect embedded print server is integrated into the device for reliable network connectivity.

Specifications

The following are the digital sender specifications.

**Paper handling**

The HP 9200C Digital Sender supports the following standard paper sizes:

- **Letter**: 215.9 x 279 mm (8.5 x 11 inches)
- **Executive**: 190 x 254 mm (7.5 x 10 inches)
- **A4**: 210 x 297 mm (8.3 x 11.7 inches)
- **A5**: 148 x 210 mm (5.83 x 8.27 inches)
- **B5**: 176 x 250 mm (6.9 x 9.8 inches)
- **Legal (from the ADF only)**: 215.9 x 355.6 mm (8.5 x 14 inches)

Paper weight: 60 to 120 g/m² (16 to 32 lb)

Up to 50 sheets of paper can be stacked in the ADF, with a maximum height of 5 mm (0.2 inch).
Performance
The following sections give specific performance statistics for the digital sender.

ADF performance
The following table shows the page per minute (ppm) speed of the digital sender ADF.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Dots per inch (dpi)</th>
<th>Speed (ppm), A4</th>
<th>Speed (ppm), Letter</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

Duty cycle
- The maximum duty cycle is 60,000 total images scanned per month.
- The average duty cycle is 3,600 total images scanned per month.
Parts of the digital sender

The following figures illustrate the digital sender parts.

1. Jam release button
2. Control panel
3. On/off switch
4. Output bin
5. ADF input bin
6. ADF cable
7. Control-panel cable
8. 10/100Base-T network port
9. EIO port
10. Power connector
11 Scanner lock
12 Serial number

The following figure shows the features of the digital sender control panel.

1 Touchscreen graphical display
2 Numeric keypad
3 **Reset** button
4 **Menu** button
5 **Sleep** button and LED
6 **Status** button
7 **Stop** button
8 **Start** button and LED
9 **Attention** LED
10 **Data** LED
11 **Ready** LED
12 Contrast control wheel
Environment and network

The following are environment and network considerations for the product.

**Environmental ranges**

Install the device in an area that is within the following temperature and humidity ranges.

**CAUTION**

The operating environment should be stable, with no abrupt changes in temperature or humidity that might damage the device. If you move the device from a cold environment to a warm one, wait about two hours before using it.

<table>
<thead>
<tr>
<th>Temperature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Operating</strong></td>
<td>0° to 40°C (32° to 104°F)</td>
</tr>
<tr>
<td><strong>Storage</strong></td>
<td>-40° to 60°C (-40° to 140°F)</td>
</tr>

<td><strong>Storage</strong></td>
<td>15 to 90% (up to 60°C [140°F])</td>
</tr>
</tbody>
</table>

**Network components used for digital-sending**

The following table describes the network components used for digital sending.

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
</table>
| Network server running Windows® 2000 Professional, Server, or Advanced Server; Windows XP Professional; or Windows Server 2003 Standard or Enterprise Server | The server contains the following components:  
- HP DSS  
- HP MFP DSS Configuration Utility—used to configure and monitor digital-sending features after the HP DSS program has been installed  
- Windows 2000 Fax service—required only when the Windows 2000 Fax service is the method of fax transport |
| Network | Fast Ethernet 100Base-TX or Ethernet 10Base-T |
Digital senders or HP multi-function peripheral (MFP) products

An HP DSS server can support up to 250 HP 9200C Digital Senders or MFP products on the same network. Each device can be individually configured to support any or all of the digital-sending options.

**NOTE**
HP DSS does not support the HP 9100C or 8100C Digital Senders.

Web browser

Users can use a Web browser from any computer on the network to configure and monitor the digital sender by using HP Web Jetadmin, or the digital sender's embedded Web server.

SMTP gateway

This gateway facilitates the e-mail and Internet fax digital-sending options.

LAN fax server

A LAN fax server is a network device that centrally handles the sending and receiving of large numbers of fax jobs. HP DSS can be used to configure the digital sender to route outgoing faxes to a LAN fax server.

LDAP server

An LDAP server is a directory server that contains recipients' names and e-mail addresses and supports Lightweight Directory Access Protocol (LDAP). HP DSS uses the LDAP server to obtain addresses for the digital-sender address book.

FTP server

A file transfer protocol (FTP) server can be used as a destination for documents scanned by the digital sender.

Domain controller/Novell directory server

In order to support user authentication, the digital sender must have access to a domain controller or Novell directory server in order to validate the user's login information.

Network printer

A network printer can be set up as a destination for documents scanned by the digital sender.

**Novell NetWare support**

If Novell file servers are used on the network, HP DSS can write files into network folders and support network fax folders that reside on Novell servers. The Novell client software must be installed on the network and be configured correctly before Novell-specific attributes can be configured in HP DSS.
In order to support Novell NetWare authentication and Novell digital sending destinations, HP DSS requires both of the following components:

- Novell NetWare version 3.12, 3.2, 4.11, 4.2, 5, or 6 running on the Novell NetWare server
- Novell NetWare Client version 4.6 (or later) installed on the Windows computer that runs HP DSS

**Space requirements**

The following figures illustrate the space requirements for the HP 9200C Digital Sender.

**NOTE**

The digital sender requires 90 mm (3.5 inches) of free space behind the device in order to fully open the top.
Configuring HP DSS

Without using the HP DSS service, the digital sender can only scan documents and send them as attachments to e-mail. If you prefer, the digital sender can be used in this way, without installing the HP DSS service. The e-mail settings can be configured by using the control-panel menus. However, to enable all of the other digital-sending features, including send-to-folder, send-to-fax, and send-to-workflow, the HP DSS service must be installed.

The digital-sending features must be configured within the HP DSS service before they can be made available on the device. This section explains how to configure these digital-sending features.

Using the Digital Sending Software

NOTE

See the HP 9200C Digital Sender Getting Started Guide for instructions about unpacking the digital sender, installing the software, and setting up the initial configuration. The following instructions cover the configuration options in more detail.

Use the HP MFP Digital Sending Software Configuration Utility to configure all of the digital-sender features. Each feature that is enabled appears on the digital-sender control-panel display as an option.

Use the following instructions to open the program.

1. On the server where HP DSS was installed, click Start, click Programs, click Hewlett-Packard, click HP MFP Digital Sending Software, and then click Configuration Utility.
2. In the HP Digital Sending Software Configuration dialog box, select This computer and click OK.

General tab

The General tab contains HP DSS license and administrator contact information.

When the HP Digital Sending Software is installed for the first time, the software is fully functional in trial mode for a set period of time. The Licenses section of the General tab displays a “Trial License” entry. The remaining trial period is displayed in this entry. When the trial period expires, the software becomes inactive until a valid license is installed.

The digital sender comes with a one-seat license. Additional licenses can be purchased in 1, 5, 10, and 50 seat varieties. Each seat enables digital sending features on one digital sender or MFP. You can install as many licenses as you like in order to accumulate seats, but 250 is the maximum number of devices that can be supported by a server.
Click the Add button to type in the license key code for the HP Digital Sending Software.

Fill in the administrator contact information in the Administrator Information section of this tab. Select the Notify administrator of critical errors check box if you would like to be notified by e-mail about errors that require administrative assistance.

**NOTE**
Click the Help button to get more information about this tab.

**E-mail tab**

The device can send SMTP e-mail messages to Internet addresses. It uses SMTP-MIME to deliver these messages. It is highly recommended that the SMTP gateway be located on your own local area network. However, you can also configure your product for e-mail functionality even if your mail services are provided by an outside Internet service provider (ISP) over a digital subscription line (DSL).

If your server supports it, ESMTP (Extended SMTP) can be used to send e-mail. This capability is automatically detected and no specific configuration steps are necessary. The e-mail service is also compatible with the DSN (Delivery Status Notification) standard.

The document that you scan at the device becomes an attachment to your e-mail message. The portable document format (.PDF) file format is most often used for the attachments, which gives recipients the ability to both view and print them. Users can obtain a free copy of the Adobe® Acrobat® Reader for viewing .PDFs from the Adobe Systems Incorporated Web site (http://www.adobe.com).

Use the E-Mail tab of the configuration program to configure and organize the SMTP e-mail servers that HP DSS uses to send e-mail messages.
To add SMTP servers

1. Click **Find Servers** to find all of the SMTP servers on the network.

2. A list of SMTP servers appears. Select one or more and click **OK**. The selected servers are loaded into the **SMTP Gateway Server** list.

**NOTE**
If the discovery process does not find any SMTP servers, use the **Add** button on the **E-mail** tab to add the SMTP server manually by typing in the host name or IP address of the SMTP server.
3. Select each server and click the **Edit...** button.

The **Edit SMTP Gateway** dialog box appears.

4. If you want to set a maximum file size for the specified SMTP gateway, select it in the **Maximum File Size** drop-down list. If an e-mail attachment is larger than this file size, the attachment will be divided into two or more smaller attachments.

5. Click **Test** to verify the presence of the SMTP gateway.

   **NOTE**
   If the test fails, double-check the gateway address and then contact your network administrator to see if the SMTP server is functioning.

6. Click **OK** to save the SMTP settings.
7. Add more SMTP servers as needed, and use the **Move** arrow buttons to change the priority order.

8. Click **Apply** to save the E-mail settings.

**NOTE**
Click the **Help** button to get more information about this tab.

**Secondary E-mail tab**

A number of third-party software vendors offer services for secure e-mail delivery. For example, Omtool offers a secure email solution that encrypts email messages and requires authentication for recipients before the email message can be delivered. These programs help organizations comply with new laws being enacted such as the E-sign act and the HIPAA requirements for electronic delivery of confidential documents. The Secondary E-mail feature is designed to work with one of these third-party software programs for users that require an extra measure of data security. It differs from the regular e-mail feature in that the data between the device and the HP DSS server is encrypted. An rfc822-compliant e-mail message that includes the scanned data as a MIME attachment is created in the folder “\HPEMAIL2” in the HP DSS program directory on the HP DSS server. The third-party software program, which is monitoring this folder, processes the e-mail message and sends it out in a secure manner.
The **Secondary E-mail** tab contains settings for the secure e-mail option.

1. To enable the Secondary E-mail option, select the **Enable Send to Secondary E-mail** check box.

2. The name of this feature can be altered to more closely reflect the third-party program's functionality (such as Secure or Encrypted E-mail). The name provided here will be displayed on the digital sender's control panel home screen. Use the **Home Screen Display Name** field to specify the display name. Type a custom display name into the **Home Screen Display Name** box or select from one of the following options:
   - Secondary E-mail
   - Secure E-mail
   - Specialized E-mail

3. Click the **Advanced...** button on this tab to specify any X-Headers that you want to include in the e-mails.

   X-Headers provide the administrator with the capability of providing a user-defined header that will be inserted in the rfc822 file for each Secondary E-mail message sent by the digital sender. The third-party e-mail software program can then perform actions based on this header information.

   **NOTE**
   
   Click the **Help** button to get more information about this tab.

---

**Authentication tab**

Use the **Authentication** tab to control how users are authenticated when using the digital-sending features. Authentication is an important security feature of the digital sender. It is highly recommended that you enable authentication on the digital sender in order to prevent unauthorized use.
Authentication consists of two interdependent parts. First, the device verifies the user’s credentials by using the selected authentication method. Then, the device attempts to find the user’s e-mail address in the database of an LDAP server by using settings specific to your LDAP server. If either step fails, the user is denied access to the digital-sending features. These two steps utilize two distinct technologies (an authentication server and an LDAP server), except in the case of the LDAP server method, where both steps are accomplished by using the LDAP server.

To enable authentication, start by selecting an option from the Authentication Method drop-down list. The following options are available.

- None
- Microsoft® Windows
- LDAP server
- Novell NDS (if Novell client software is present)
- Novell Bindery (if Novell client software is present)

**LDAP Configuration**

After you select the authentication method on the Authentication tab, the LDAP configuration settings appear. The device uses LDAP to retrieve the e-mail address for the authenticated user. After the user has provided valid credentials, the software uses this information to match an attribute in the LDAP database. After the match is made, and the user is identified in the database, the user’s e-mail address is retrieved by using another database attribute. The LDAP settings include the following options.

- Options for configuring HP DSS to gain access to the LDAP server
- Options for searching the database to obtain user e-mail addresses
To configure the LDAP server

1. Click the **Find Servers** button. The program searches the network for LDAP servers, and might also prompt you for your network username and password, depending on your network configuration. Next, the **Select LDAP Server** dialog box appears, containing a list of LDAP servers on the network.

2. Select the LDAP server that you want to use. The information about the selected server appears.

3. Click **OK** to accept the selected server. The server information is filled in on the **Authentication** tab.

4. Click **Find Settings**. The server settings appear in a dialog box. Click **Yes** to accept the settings.

5. Click the **Test** button on the **Authentication** tab to test the settings. In the **Test User Authentication** dialog box, type in the network logon credentials of a user in order to test whether LDAP can successfully retrieve an e-mail address.

**NOTE**

If the **Find Servers** process fails to find any LDAP server, you can type the host name or IP address of the LDAP server directly into the **LDAP Server** text box, and then use the **Find Settings** button to retrieve the server's settings. See **Troubleshooting SMTP and LDAP servers** for more information, and if you are unable to communicate with the LDAP server, contact your network administrator for help with troubleshooting.

**NOTE**

Click the **Help** button to get more information about this tab.

**Fax tab**

If this feature is enabled, users can send faxes directly from the device. They can select destinations from an address book if one is loaded, or type fax numbers in at the control panel. The same document can be sent to multiple fax numbers.
The configuration program Fax tab controls all of the HP DSS fax settings.

To configure the fax option, first select the fax delivery method from the Faxing Method drop-down list. The following options are available.

- None
- LAN Fax
- Internet Fax
- MS Windows 2000 Fax

Depending on which method is selected, the applicable settings appear on the Fax tab. Fill in these settings to complete the fax configuration process.

**To set up a LAN fax service**

Follow these instructions to set up faxing from the digital sender by using your network's LAN fax service.

1. Select LanFax from the drop-down list on the Fax tab.
2. Select your LAN fax software product name from the Product Name drop-down box.
3. Click the Advanced button to set up input and output settings for your LAN fax product.
4. Use the Browse button to select the network folder that your fax software uses.
5. Fill in the Credentials to Access Folder section, if required. Use the Verify Folder Access button to test the credentials and make sure that you have access to the folder.
6. Click Apply to save the LAN fax settings.
To set up an Internet fax service

With an Internet fax service, faxes are sent by e-mail. When using HP DSS, the user specifies a fax number at the device, and then the software creates and sends the e-mail behind the scenes.

1. Select **Internet Fax** from the drop-down list on the **Fax** tab.

2. Type the domain name for your Internet fax provider into the **Fax Provider Domain** text box, for example, **efax.com**. HP DSS takes the phone number that is typed at the device and then uses this domain name to create the e-mail, for example, [phone number]@efax.com.

3. Type a valid e-mail address into the **Default Fax Account e-mail address** text box. The fax service uses this e-mail address for billing purposes and for any returned or failed Internet fax e-mail.

4. Select the check box if you want HP DSS to use the authenticated user's e-mail address as the return e-mail address.

5. Click **Apply** to save the Internet fax settings.

To set up a Windows 2000 fax service

In order to use the Windows 2000 fax service, you must have a fax modem installed on the HP DSS server.

1. Select **MS Windows 2000 Fax** from the drop-down list on the **Fax** tab.

2. Click the **Fax Properties** button. The Windows **Fax Console** dialog box appears. Use the **Tools** menu to configure any settings, if needed.

3. Click **Apply** to save the Windows 2000 fax settings.

**NOTE**

Click the **Help** button to get more information about the **Fax** tab.
Folders tab

Use the Folders tab to set up the send-to-folder feature. To enable this option, select the Enable Send to Folder check box.
To add folders to the Folders list

1. Click **Add…** to add a new folder. The **Add Predefined Folder** dialog box appears.

2. Type a name for the folder into the **Alias Name** text box. This name appears in the device control-panel interface.

3. **Predefined Folder:**
   - **Predefined Folder:**
   - **Folder Path:**
   - **Access Control:**
     - **Access Method:**
     - **User Type:**
     - **Password:**
     - **Expiration:**

4. **Browse:**
   - **Browse:**
   - **Public:**
   - **Owner:**
   - **Editor:**
   - **Viewer:**

5. **Add:**
   - **Add:**
   - **Cancel:**
   - **Help:**

20 Chapter 2 Configuring HP DSS
3. Click **Browse**… to browse to a folder location, and then click **OK** to accept it.

**NOTE**

4. Select the credentials that you want to use for access to the folder from the **Access Credentials** drop-down list. If **Public** is selected, the program uses the **Credentials to Access Public Folders** from the **Folders** tab. If **MFP User** is selected, the program uses the credentials with which the user has logged into the device.

5. Click **OK** to save the settings. The new folder is added to the list.

6. Repeat steps 1 through 5 to add more folders.

7. Type in the public access credentials that are required for access to folders in the **Credentials to Access Public Folders** area of the **Folders** tab. This information is required before you can save the folder list.

8. Click **Apply** to save the new folders.

**NOTE**
Click the **Help** button to get more information about this tab.

**Workflows tab**

With workflows, users can scan a document and send it to a custom workflow destination. The workflow feature gives users the ability to send additional information in the form of a file that is saved with the scanned document in a specified network or FTP location. Prompts at the control panel are used to collect specific information. A third-party software program monitoring the network folder or FTP site can then retrieve and decipher the information, performing the specified operation on the scanned image. You can also set up a printer as a workflow destination, which allows users to scan a document and then send it directly to a network printer to be printed.
Use the **Workflows** tab to set up workflow processes for use with third-party software programs. To enable this feature, first select the **Enable Workflows** check box at the top of the tab.

Creating a workflow process consists of three parts:

- The workflow group, which defines which workflow menus and forms will be available on the control panel of the digital sender.
- The workflow menu, which creates logical groups of workflow forms.
- The workflow form, which collects information entered by the user at the control panel before initiating a send-to-workflow job.

**To create a workflow group**

1. Click the **Add Group** button. The **Workflow Group** dialog box appears.
2. Type the name of the new group. The name must be unique.
3. Click **OK** to save the new group.
To create a workflow menu

1. In the workflow tree, select the group that you just created.
2. Click the **Add Menu** button. The **Workflow Menu** dialog box appears.

3. Type the name of the new menu. This name must be unique within the workflow group.
4. Select the style of the workflow menu. The style determines which options are available for workflow forms within this workflow menu. The only available choice is **Enhanced**.

5. Click **OK** to save the new workflow menu.

**To create a workflow form**

1. Select the workflow menu that you just created.

2. Click the **Add Form** button. The **Workflow Form** dialog box appears.
3. Type a name for the new form into the **Form Name** text box.

4. Select the destination type from the **Destination Type** drop-down list. The options are Folder, FTP Site, and Printer.

**NOTE**

Based on the option that you select, the options on the **Workflow Form** dialog box change. The remainder of this procedure applies to the Folder option. See the following sections, **To create a workflow form for an FTP site** and **To create a workflow for a printer**, for instructions for creating a workflow form for an FTP site or a printer.

5. Type the path for the destination folder in the **Folder Path** text box, or use the browse button to select a path.

6. Select the access method for the folder from the **Access Credentials** drop-down list. The choices are "Public" and "MFP User." If MFP User is selected, HP DSS uses the credentials of the user that is logged in to the device. If Public is selected, HP DSS uses the **Credentials to Access Public Folders** that are specified on the main **Workflows** tab.

7. Under **Image File Settings**, select the settings for the scanned file. These should be the settings that are required by the third-party software program that processes the file.

8. Select the file type for the metadata file from the **File Format** drop-down list. The options are None, .HPS, or .XML. This is the file that contains the data that the workflow prompts collect. If you are not creating any prompts, you can select None.

9. Select the **Generate OCR File** check box under **OCR Settings** if the processing software program needs an OCR (optical character recognition) file. Click the **Settings** button to specify the OCR settings for language and output file format.

10. In the **Prompts** area, you can define prompts and expected responses for the user of the workflow form. The prompts appear on the device control panel. The responses to the prompts are saved in the metadata file, which is stored with the document image for use by the third-party workflow software program.
Follow these instructions to add prompts.

a. Click the Add button to add prompts.

b. In the Add Prompts dialog box, click the New button to create a new prompt. This opens the Workflow Prompt dialog box.

c. Under Prompt Settings in the Workflow Prompt dialog box, type the Prompt Name, the Prompt Text, and any Help Text for the prompt. The Help text appears if the user touches the Help button on the digital-sender control panel while the prompt is on the screen.

d. Under Response Settings, select the Response Format. The Response Format options are String, Numeric, Date, Time, or Privacy.

NOTE
The Privacy response format uses asterisks (*) to hide what the user types in on the control panel. This response type can be used for private information such as a password or an employee number.

e. Under Response Type, select User Editable or Selection List. If User Editable is selected, you can select the User must supply a response check box to require a response.

f. If applicable, type a default response in the Default Response text box. The program uses the default response if the user does not provide a response to the prompt.

g. Click OK to save the prompt settings. The new prompt is added to the Prompts List in the Add Prompts dialog box.

h. Repeat steps b through g as needed to create more prompts.

i. After creating all of the required prompts, you can use the Move buttons at the bottom of the list to adjust the order of the prompts.

j. Click OK to accept the new set of prompts. The new prompts appear in the Prompts area of the Workflow Form dialog box.

11. Click OK to accept all of the settings on the Workflow Form dialog box. The new form appears in the workflows list on the Workflows tab.

NOTE
A workflow form can be edited at any time by selecting it and then clicking the Properties button.

12. Type the public access credentials for access to workflow folders in the Credentials to Access Public Folders area of the Workflow tab. This information is required before you can save the workflow settings.

13. Click Apply to save the new workflow settings.
To create a workflow form for an FTP site

1. In the Workflow Form dialog box, select FTP Site in the Destination Type drop-down box.
2. Type the host name or IP address of the FTP server into the FTP Server text box.
3. Click the Credentials button, and then type in the user name and password that are required for the FTP server. Click OK to save the credentials.
4. In the FTP Path text box, type in the path to the directory on the FTP server that you want to use for the scanned documents.
5. Follow Steps 7 through 11 in the previous procedure to complete the remainder of the workflow form settings and add any prompts.
To create a workflow for a printer

You can use a workflow form to send a scanned document to a network printer to be printed.

1. In the Workflow Form dialog box, select Printer in the Destination Type drop-down box.
2. Select a printer from the Select Printer drop-down box, which lists the available network printers.
3. Select one of the radio buttons to use the default or custom printer preferences. If you select custom printer preferences, click the Preferences button to set them up.
4. Click OK to save the workflow form.
5. Click Apply to save the settings on the Workflow tab.

NOTE

Click the Help button on the Workflows tab or any of the workflow dialog boxes to get more information.

Addressing tab

Use the Addressing tab to configure HP DSS to make centralized address books available to digital-sender users.
LDAP directory replication

An address book is available on the digital sender to speed up the process of selecting e-mail and fax destinations from the control panel. The e-mail addresses and fax numbers in the address book come from several sources:

- The LDAP server on the network
- Destinations previously specified by users at the control panel
- E-mail and fax address books created with the HP Address Book Manager

You can use one of two methods to synchronize the digital-sender address books with the LDAP server.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Effect at the control panel</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using a replicated LDAP address book</td>
<td>HP DSS takes a snapshot of the LDAP server’s database and populates the digital sender's address book with the addresses that it finds. The HP MFP DSS Configuration Utility can be used to either manually initiate the task or schedule it to run automatically at a certain time.</td>
<td>As you type the initial characters in a name, the digital sender attempts to complete the name from the names in the address book. You type more characters until a match is found. When you select a name, the associated e-mail address is automatically selected.</td>
</tr>
<tr>
<td>Using an LDAP address book directly</td>
<td>Firmware in the digital sender initiates and resolves name queries directly with the LDAP server. You do not have to synchronize the address book with the LDAP server, either manually or according to a schedule.</td>
<td>You type a partial name. The digital sender displays the list of resulting names from the LDAP server. When you select a name, the associated e-mail address is automatically selected.</td>
</tr>
</tbody>
</table>

**NOTE**

If the digital sender is configured to use an LDAP address book directly, it cannot access the replicated address book.

If replication is enabled, only the display names and e-mail addresses are replicated.
To set up automatic replication of the LDAP address book

1. Click the **Settings...** button. The **Replicating LDAP Address Book** dialog box appears.
2. Select the **Enable LDAP Directory Replication** check box.
3. On the **LDAP Settings** tab, set up the necessary parameters for logging into the LDAP server and searching the LDAP database. See **LDAP Configuration** for more information. After setting up the LDAP parameters, you can also click the **Advanced** button to set up more advanced LDAP search options.
4. On the **Replication** tab, select the schedule for replicating the LDAP database. If you select **Daily**, **Weekly**, or **Monthly**, you can set a specific time and day of the week for the replication process.

**Personal address books**

Select the **Enable PABs** check box to enable users to use their personal address books to address e-mail on the digital sender. Personal address book support is only available if authentication is enabled and the authentication method is set to Microsoft Windows (see **Authentication tab**). The Microsoft Messaging API (MAPI) is also required to interface with a user's personal address book. Make sure that the Windows Messaging Component is installed. If you have a MAPI client software program installed (such as Microsoft Outlook), this component should already be in place.
**DSS address books**

HP DSS uses address books to store e-mail addresses that a user types at the device. If user authentication is enabled on the device, addresses are stored in a user's individual HP DSS address book. Otherwise, the addresses are stored in a public HP DSS address book. HP DSS address books are available to every digital sender or MFP that HP DSS supports. If the addresses that are contained in these address books are no longer needed, you can clear out any or all of the HP DSS address books by clicking the **Clear** button in the **DSS Address Books** section of the **Addressing** tab. This displays a list of any existing address books.

See [Working with address books](#) for more details on address books.

**NOTE**

Click the **Help** button to get more information about the **Addressing** tab.

**Preferences tab**

The **Preferences** tab specifies the path for the HP DSS temporary files. These files can be very large, so you should select a location that has sufficient disk space. Click the **Browse...** button to select a location.

Click **Apply** to save the new folder path if you change it.

**NOTE**

Click the **Help** button to get more information about this tab.
MFP Configuration tab

The **MFP Configuration** tab specifies which digital senders and MFPs are using the HP DSS service, and also provides an interface for customizing HP DSS features for specific digital-sending devices.

---

MFP Configuration tab

1. MFP list
2. **Configure MFP** button
3. **Add** button
To add a new digital sender or MFP

1. Click the **Add...** button near the bottom of the tab. The **Add MFPs** dialog box appears.

2. Click the **Find MFPs** button to find all of the MFPs and digital senders on the network. Select the device you want to add from the list that appears.

   **NOTE**
   If you know the hostname or IP address of the device, you can type it in the **Hostname or IP Address** text box under **Manually enter an MFP’s network name** rather than using the **Find MFPs** button.

3. If you want the device that you are adding to use the same settings as a previously configured device, select the previously configured device from the **When adding new MFPs copy settings from** drop-down list.

4. Click the **Add-->** button to add the device to the **MFP List**.

   **NOTE**
   You can only add as many digital senders or MFPs as you have "seats" available in your HP DSS license. Near the top of the **Add MFPs** dialog box you can see how many seats you have available.

5. Click **Close** to close the **Add MFPs** window.
To configure an individual digital sender or MFP

1. Select the digital sender or MFP from the list on the MFP Configuration tab.

2. Click the Configure MFP... button. The dialog box that appears looks similar to the main Configuration program interface. Use this interface to customize the specific digital-send settings for this device. Settings that are specified on these tabs override the settings that are made on the general HP DSS Configuration program tabs.

   **NOTE**
   You must use this interface to enable the digital sending features for the individual devices. Even if a feature is enabled on the HP DSS configuration tabs, it is not enabled on the device until it has been enabled in the Configure MFPs interface.

3. On the Authentication tab, select the Enable Authentication check box to enable authentication for the selected device. Select the check boxes next to the features that you are enabling. This requires the user to log in before using that feature. Select the network domain from the Default Domain drop-down box.

4. On the Send to Email tab, select the Enable Send to Email check box, and select via the Digital Sender service in the Send Emails drop-down list.

5. If you would like the users to be able to add their own e-mail message when sending e-mail, click the Advanced button and select the Editable by user check box.

6. On the Addressing tab, select the Allow MFP to directly access an LDAP Address Book check box if you want HP DSS to retrieve e-mail addresses directly from an LDAP server. Select the previously-configured LDAP server in the LDAP Server drop-down list.

7. On the Send to Email (2) tab, select the Enable Send to Secondary Email check box if you are using the secondary e-mail feature. Select the display name for the secondary e-mail service from the Home Screen Display Name drop-down list.

8. On the Send to Fax tab, select the Enable Send to Fax check box if you are using the fax feature. Make sure that via the Digital Sending service is selected in the Send Faxes drop-down list.

9. On the Send to Folder tab, select the Enable Send to Folder check box if you are using this feature.

10. On the Send to Workflows tab, select the Enable Send to Workflows check box if you are using workflows. In the Workflow Group drop-down box, select the group that contains the workflow menu and form that you want to use for this device.

11. Click OK to save all of the changes.

12. Click Apply to update the MFP Configuration settings.

   **NOTE**
   The settings are not propagated to the digital sender until you click the Apply button.

To configure a group of digital senders or MFPs

If you need to configure a group of digital senders or MFPs, you can configure them all at one time rather than one by one. To do this, hold down the Shift key or Ctrl key on your keyboard and then click on the devices you want to configure on the MFP Configuration tab. Then click Configure MFP to configure the entire group.

   **NOTE**
   The devices you select must all be of the same type. For example, they must be all digital senders, or all MFPs of a specific model type.
NOTE Click the Help button to get more information about the MFP Configuration tab.

Log tab

The Log tab shows the HP DSS activity log. This log contains all of the activities that the HP DSS service performs. The following information is included in the list for each log entry:

- Severity
- Event
- Date and Time

Click the Details button to open a Details dialog box that provides additional information about the selected log event.

NOTE Click the Help button to get more information about this tab.

About tab

The About tab provides HP DSS version information.

NOTE Click the Help button to get more information about this tab.

Testing the configuration

After configuring all of the digital-sending features, you should test them on the digital sender. Verify that all of the enabled options appear on the digital-sender control-panel display. Then try each option to make sure that the document is successfully delivered to the correct location.

Uninstalling the software

Uninstall the HP DSS service software by using one of the following procedures.

To uninstall the software with the uninstall program

NOTE To uninstall the software from Windows 2000 or XP, you must log on with administrator privileges.

1. Close all of the open programs.
2. On the Start menu, point to Programs, point to Hewlett-Packard, point to HP MFP Digital Sending Software, and then click Uninstall.
3. In the **Confirm Uninstall** dialog box, click **OK**.
4. The uninstall process removes the program from your computer. At the end of the process, you might have to restart your computer.

**To uninstall the software with Add or Remove Programs**

An alternate method for uninstalling the digital sender software is to use the Windows **Add or Remove Programs** method.

1. Click **Start**, point to **Settings**, and then click **Control Panel**.
2. Click **Add or Remove Programs**.
3. Scroll through the list of software programs and click **HP MFP Digital Sending Software**.
4. Click **Remove**.
Using the embedded Web server and HP Web Jetadmin

The embedded Web server (EWS) and HP Web Jetadmin are two online tools that can be used to remotely administer the device.

The embedded Web server

This digital sender is equipped with an embedded Web server, which provides access to information about digital sending and network activities. When a Web server is "embedded," that means that it resides on a hardware device (such as a digital sender) in the firmware, rather than as software that is loaded on a network server. The advantage of an embedded Web server is that it provides an interface to the device that anyone who has a network-connected computer and a standard Web browser can use. You do not need to install or configure any special software.

Features

Use the EWS to view the digital sender and network status and to manage digital sending functions from your computer. With the EWS, you can complete the following tasks:

- View digital-sender status information
- Determine the remaining life on the ADF Maintenance Kit
- View the control-panel menu configuration
- View device configuration reports
- Receive notification of digital-sender events
- Add or customize links to other Web sites
- Select the language in which to show the embedded Web server pages
- View and change network configuration
To view the EWS Web pages

To view the EWS Web pages, you need to have the device's IP address. You can find the IP address in one of the two following ways:

- Go to the digital sender and look at the upper-left corner of the touchscreen. Next to the word Ready the IP address should appear.

- If the IP address does not appear on the touchscreen, press the Menu button on the control panel. Touch the INFORMATION menu, and then touch CONFIGURATION. The digital-sender configuration information appears on the touchscreen. Touch the OK button to see the Jetdirect data. Scroll through the information until you find the IP address.

Open a Web browser and type the digital sender's IP address into the Address box to open the EWS Web page.

NOTE
You can gain access to the embedded Web server from any operating system that supports the TCP/IP protocol and a Web browser, preferably either Netscape Navigator 4.7x or Microsoft Internet Explorer 5.0x or later. You cannot view the embedded Web server pages from outside a firewall.

Information pages

The pages on the Information tab of the embedded Web server provide status information for the digital sender.

- **Device Status page**—This page shows the status message that currently appears on the device control panel.

- **Configuration page**—The digital-sender Configuration page lists device information that includes the serial number, and other information about the device. It also has an Options list that lists options that are installed in each DIMM slot, CompactFlash slot, and EIO slot. The Memory section of the page lists the digital-sender memory (RAM) information, and the Security section lists the status of the security features.

- **Supplies Status page**—This page shows the status of the ADF Maintenance Kit, and indicates how soon it needs to be replaced.

- **Usage page**—This page shows how many pages have been scanned by the device and how many pages have been scanned with the ADF and the flatbed.

- **Device Information page**—This page lists the device name for network management needs, and shows the IP address for the device.

NOTE
The device name can be edited on the Settings tab.

- **Control Panel page**—The Control Panel page shows a snapshot of the current state of the control panel. Click the Refresh Image button to refresh the snapshot.
Settings pages

The pages on the Settings tab of the EWS contain a variety of digital-sender settings.

- **Configure Device page**—The options on this page are the same as some of the menus on the device control panel. Use this page to configure some of the digital-sending options.

- **E-mail Server page**—Use this page to set up the SMTP server that should be used to send digital sender e-mail alerts (set up on the Alerts page).

- **Alerts page**—Use this page to set up e-mail alerts for many digital-sender events. These alerts can be sent to a list of up to 20 e-mail, mobile device, or Web site destinations.

- **AutoSend page**—Use the AutoSend screen to send product-configuration and usage information periodically to your service provider. This feature establishes a relationship with Hewlett-Packard Company or another service provider to provide you with services that include support agreements and usage tracking.

- **Security page**—Use the Security page to set up a password to prevent unauthorized users from gaining access to device configuration settings. After a password has been set, any user opening the EWS Web page only sees the Information tab. To view the other tabs, you must click the Log In link in the upper right corner of the screen and log in using the password.

**NOTE**

For security reasons, it is strongly recommended that you set up a password to protect the digital sender EWS. This prevents unauthorized users from making configuration changes. See Controlling security for more information about security.

- **Edit Other Links page**—Use this page to add links to the Other Links box, which appears in the lower-left corner of the EWS Web pages.

- **Device Information page**—Use this page to change the device name, asset number, and company contact information.

- **Language page**—Use this page to specify the language that the EWS Web pages use.

- **Date and Time page**—Use this page to set the correct date and time for the device.

- **Wake Time page**—Wake Time can be set to wake the product up at a certain time on a daily basis. There can only be one wakeup setting per day; however, each day can have a different wakeup time. The sleep mode delay can also be set on this page.

Digital sending pages

The pages on the Digital Sending tab of the EWS control configuration of the digital-sending features. Because the digital sender uses the HP DSS service to carry out its digital sending tasks, it must be configured by using the HP MFP DSS Configuration Utility. This centralizes configuration tasks and helps control security. Therefore, you do not have access to any of the configuration settings on the Digital Sending tab as long as the digital sender is using the HP DSS service.
Networking pages

The pages on the Networking tab of the EWS provide information about the digital sender HP Jetdirect Inside embedded network connection and contain tools that you can use to configure some specific network settings.

HP Web Jetadmin

HP Web Jetadmin is a server-based online tool that system administrators can use to configure all of the printers and digital senders on their network. If you have a number of HP digital senders and printers, this is a useful tool for controlling and configuring them as a group rather than one by one. For supported host systems and available languages, and to download the software, go to http://www.hp.com/go/webjetadmin.
Using the control-panel menus

The control-panel menus provide access to a wide variety of digital-sender settings. Some configuration settings can only be changed by using the control-panel menus.

To view the control-panel menus, push the MENU button on the control panel.

Information menu

Use the Information menu to view some digital-sender configuration and statistical information.

<table>
<thead>
<tr>
<th>Item</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHOW CONFIGURATION</td>
<td>Shows the configuration information for the device. Click OK at the bottom of this screen to see the EIO/HP Jetdirect information.</td>
</tr>
<tr>
<td>SUPPLIES STATUS</td>
<td>Shows the remaining life for the ADF Maintenance Kit. See The ADF Maintenance Kit.</td>
</tr>
<tr>
<td>SHOW USAGE</td>
<td>Shows usage statistics for the number of pages that have passed through the ADF and the number of scans that have been done.</td>
</tr>
</tbody>
</table>

NOTE
To view these reports in a printable format, open them by using the EWS Web pages. See Information pages in the EWS section.

Configure Device menu

The administrator can use the control-panel Configure Device menu to configure the device directly from the control panel. This menu contains the following submenus:

- Originals
- Enhancement
- Sending
- System Setup
- I/O
- Resets
- Security

Originals submenu

These settings control the default settings that describe the original document. The user can change any of these settings at the time of scanning by using the control-panel interface.

<td>TOUCHSCREEN</td>
<td>Divides the display into squares of a grid. You are then instructed to touch each square and see if the touch was detected.</td>
</tr>
</tbody>
</table>

**Service menu**

The Service menu is locked and can only be opened by a service technician.
Controlling security

The most basic security feature of the digital sender is its ability to require a network login before a user can gain access to digital sending functions. This prevents unauthorized users from walking up to the device and sending documents. It is highly recommended that you enable authentication when configuring the digital sender. See Authentication tab.

For users who are concerned about e-mail security, the digital sender comes with a secure e-mail option. A number of third-party software vendors offer services for secure e-mail delivery. The Secondary E-mail feature is designed to work with one of these third-party software programs for users who require an extra measure of data security. It differs from the regular e-mail feature in that the data between the device and the HP DSS server is encrypted. An rfc822-compliant e-mail message that includes the scanned data as an attachment is created in a folder on the HP DSS server. The third-party software program, which is monitoring this folder, processes the e-mail message and sends it out in a secure manner.

To restrict software access

In order to keep the digital sender secure, you must also restrict access to the software programs that can be used to configure the device. By default, the digital-sending configuration options in the embedded Web server (EWS) are disabled when the digital sender begins using the HP DSS service. The digital sender can then only be configured by using the HP MFP DSS Configuration Utility. This centralizes configuration tasks and helps control security. You should make sure that the HP DSS is installed on a secure server and that the HP MFP DSS Configuration Utility cannot be used by unauthorized users.

In addition, you can also set a password in EWS to prevent access to the device-settings tabs. After the password has been set, users can only see the EWS Information tab. See the information about the Security page in the EWS Settings pages section.

The final software program that can be used to control the digital sender is the HP Web Jetadmin program. This program can also be configured to require a password before any changes can be made. It should also be installed on a secure server and should be protected from unauthorized use.

Security lock

The security lock is a mechanical lock that prevents the removal of internal device components. The lock used is a third-party computer lock such as the ones that are used to secure laptop computers. Purchase the lock separately, and then install it on the product in the location shown in this figure.
Working with address books

One of the roles of the digital-sender administrator is to maintain the public and private address books on the device.

Clearing HP DSS Address Books

HP DSS uses address books to store e-mail addresses that a user types at the device. If user authentication is enabled on the device, addresses are stored in a user's individual HP DSS address book. Otherwise, the addresses are stored in a public HP DSS address book. HP DSS address books are available to every digital sender or MFP that the HP DSS server supports. If the addresses contained in these address books are no longer needed, you can clear any or all of the HP DSS address books by clicking the **Clear** button on the **Addressing** tab in the HP MFP DSS Configuration utility.

Authentication and address book availability

Addresses entered directly by the user are saved differently depending on whether the user has been authenticated at the control panel.

- **Authenticated**: Saved to a “Personal” address book.
- **Not Authenticated**: Saved to a “Guest” address book. All non-authenticated users will see the contents of the “Guest” address book.
- E-mail addresses stored in Outlook contacts are available to the authenticated user.
- E-mail addresses typed directly at the control panel are cached in a private address book.

Personal address books

HP DSS accesses an authenticated user’s personal e-mail addresses stored in their Outlook contacts folder. The digital sender displays a list of personal e-mail addresses combined with addresses from other available public address books.

**NOTE**

Personal address book availability has the following requirements: Windows authentication must be enabled on the digital sender (Novell is not supported), and the HP DSS server must have an MAPI-compliant e-mail client installed.

Local address book preservation

E-mail addresses typed directly at the control panel of a digital sender that is not connected to HP DSS are stored in a local address book. When the digital sender is added to HP DSS, the local address book is imported into a “Guest” address book stored on the HP DSS server. This address book combines all of the address books of the digital senders and MFPs that have been added, making previously cached email addresses available from any digital sender or MFP.
The digital sender control panel provides the user with a choice between two views of the address book: “All” and “Personal.” The “Personal” view is provided when the user has been authenticated. Each view presents to the user a single sorted list of e-mail addresses merged from all address books currently active in that view. The following table shows which of the address books are merged in each view.

<table>
<thead>
<tr>
<th>Dynamic LDAP Enabled</th>
<th>Authentication Enabled</th>
<th>View “Local”</th>
<th>View “Personal”</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>No</td>
<td>Guest, Global (Replicated LDAP/ABM), Public Distribution List</td>
<td>Guest</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>Private, Personal, Personal Distribution List, Guest, Global (Replicated LDAP/ABM), Public Distribution List</td>
<td>Private, Personal, Personal Distribution List, Guest</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Guest, Dynamic LDAP</td>
<td>Guest</td>
</tr>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Private, Personal, Personal Distribution List, Guest, Dynamic LDAP</td>
<td>Private, Personal, Personal Distribution List, Guest</td>
</tr>
</tbody>
</table>

**Private**

The Private address book is unique to each authenticated user and provides the user a place to store (add and delete) e-mail addresses entered from the digital sender control panel. The Private address book is accessible by the user from any digital sender or MFP that is configured to use authentication for send-to-e-mail.

**Personal**

The Personal address book is unique to each authenticated user and is a copy of the user’s Microsoft Exchange Contact database. The e-mail addresses from the user’s contact list are loaded into the Personal address book and the contact lists are loaded into the Personal distribution list. The loading of these addresses and lists are initiated when the user becomes authenticated.

**Personal distribution list**

Personal distribution lists are named lists of e-mail addresses obtained from the Microsoft Exchange Server as Contact Lists and maintained in the Personal address book.

**Guest**

The Guest address book provides unauthenticated users a place to store (add and delete) email addresses entered from the digital sender control panel. The Guest address book is accessible by all users from any digital sender or MFP that is configured to use the Digital Send Service.
Global (Replicated LDAP/ABM)

The digital sender can be configured to import address book records from an LDAP server. The Global address book populated from LDAP is commonly referred to as Replicated LDAP. The HP Address Book Manager software provides functionality to populate the Global address book directly from user input or from files generated from other databases. See the Address Book Manager section below.

Public distribution list

A Public distribution list is a named list of e-mail addresses created or imported by the Address Book Manager and maintained in the Global address book.

Address Book Manager

The main purpose of the Address Book Manager is to give the administrator a way to create and change the e-mail address books stored in the HP Digital Sending Software. You must be an administrator to use the Address Book Manager.

Specifically, you can use the Address Book Manager to accomplish the following tasks:

- View, add, change, and delete information in the public address books
- View, add, change, and delete information in the private address books of authenticated users

NOTE

Address Book Manager must be installed separately. Insert the HP DSS program CD, browse to the ABM folder and run SETUP.EXE.

Follow these instructions to open the Address Book Manager:

1. From your computer, click Start, and then point to Programs. Point to Hewlett-Packard, and then click HP Address Book Manager. The Address Book Manager window appears.
2. In the Digital Sender name field, type the DNS name or IP address for the HP DSS server, or choose a previously entered DNS name or IP address from the drop-down list.
3. In the User name field, type ADMINISTRATOR.
4. In the User password field, type your password (if one is required) and click OK. If all of the information is valid, the ABM main window appears.

Using the activity log

The device keeps a record of all digital-sending events in an activity log. Up to 1,024 entries are stored in the activity log. New events overwrite the oldest events.

Icons appear in the activity log to identify the type of message:

Information—No action required
Warning—Indicates a failure of some kind that might require action.

Error—Indicates a problem that requires administrator intervention and possibly a call to an HP-authorized dealer.

The following events are recorded in the device activity log:

- Each digital sending job (for all types of destinations)
- Success or failure of an activity
- Shutdown and restart
- Deletion of address book contents
- System errors

The following information is recorded about each event:

- User
- Date and time
- Time
- Supplementary details (such as list of destinations, size and number of pages, and format)
- Description of event
- Severity of event (information, warning, error)

Three different activity logs can be viewed:

- **The HP DSS server log**—Open the HP MFP DSS Configuration program and click the Log tab to see the HP DSS server log. This shows the activity log for the HP DSS service. Clicking the Details button opens a Details dialog box that provides additional information about the selected log event. Clicking the Clear button clears the log.

- **Digital-sender activity log**—Open the HP MFP DSS Configuration program and click the MFP Configuration tab. Select the digital sender in the MFP list, and then click Configure MFP. Click the Log tab to see the activity log for the selected device. You can click the Clear button on the Log tab to clear the device activity log. See Digital-sender event log messages for an explanation of event log messages.

- **Control-panel event log**—Press the MENU button on the control panel and then touch the DIAGNOSTICS menu. Touch SHOW EVENT LOG. This shows the 50 most recent events for this device.

Clearing the log is useful if you are troubleshooting problems. After you clear the log, entries reflect only current conditions. Clearing the log is also useful when you have made major configuration changes.
Upgrading the firmware

The HP 9200C Digital Sender features remote firmware update (RFU) capability. Use the following steps for remotely upgrading digital-sender firmware. These steps are explained in more detail in the following sections.

1. Determine the current level of firmware installed on the device.
2. Go to the Web site and find out whether a new version is available. If it is, download the latest firmware to your computer.
3. Download the new firmware to the device.

Determining the current level of firmware

To determine the current level of firmware, view the configuration page on the digital-sender control panel. To view the configuration page, follow these instructions.

1. On the control panel, press the MENU button to open the menus.
2. Select the INFORMATION menu.
3. Select VIEW CONFIGURATION.
4. Scroll to the configuration section marked Device Information to find the firmware date code. The firmware date code looks something like this: 20030502 05.003.0

Downloading the new firmware from the HP Web site

To find the most recent firmware upgrade for the digital sender, go to http://www.hp.com/go/9200c_firmware. This page also contains instructions for how to download the new firmware version.

Download the new firmware version from the web site and then use one of the following methods to update the digital sender firmware.

Using FTP to upgrade the firmware on a direct network connection

The device must be in a "ready" state to receive an .RFU file update. Any jobs that are ahead of the RFU job in the queue are completed before the update is processed.

The elapsed time for an update depends on the I/O transfer time, as well as the time that it takes for the device to reinitialize. The I/O transfer time depends on a number of things, including the speed of the host computer that is sending the update. If the remote firmware update process is interrupted before the firmware is downloaded (while Receiving Upgrade appears on the control-panel display), the firmware file must be sent again. If power is lost during the flash DIMM update (while the Performing Upgrade message appears on the control-panel display), the update is interrupted and the message Resend Upgrade appears (in English only) on the control-panel display.

Follow these instructions to perform the upgrade by using FTP.
NOTE
The firmware update involves a change in the format of nonvolatile random-access memory (NVRAM). Any menu settings that are changed from the default settings might return to default settings and must be changed again if you want settings that are different from the defaults.

1. If you do not already have it, get the TCP/IP address of the digital sender from the EIO Jetdirect page. The HP Jetdirect page is the second page that you see when viewing the configuration page on the control panel.

NOTE
Before connecting to the digital sender, make sure that it is not in Sleep mode. Also make sure that any error messages are cleared from the control-panel display.

2. Open a command window on your computer.
3. Type: `ftp <TCP/IP ADDRESS>`. For example, if the TCP/IP address is 192.168.0.90, type `ftp 192.168.0.90`.
4. Press Enter on the keyboard.
5. When prompted for the user name, press Enter.
6. When prompted for the password, press Enter.
7. Type `bin` at the command prompt.
8. Press Enter. The message `200 Types set to I, Using binary mode to transfer files` appears in the command window.
9. Type `put <FILENAME>`, where `<FILENAME>` is the path to the .RFU file that was downloaded from the Web. For example, type `put C:\LJ\3500FW.RFU`, and then press Enter.

NOTE
If the file name or path includes a space, you must enclose the file name or path in quotation marks. For example, type `put "C:\MY DOCUMENTS\LJ\3500FW.RFU"

The following series of messages appears in the command window:

- **200 PORT command successful**
- **150 Opening BINARY mode data connection**
- **226 Ready**
- **226 Processing Job**
- **226 Transfer complete**

Then, a message containing transfer-speed information appears.

10. The download process begins and the firmware is updated on the device. This can take about five minutes. Let the process finish without further interaction with the device or computer.

NOTE
The digital sender automatically restarts the firmware after processing the upgrade.

11. At the command prompt, type `bye` to exit the ftp command.
12. At the command prompt, type `exit` to return to the Windows interface.
Using HP Web Jetadmin to upgrade the firmware

This procedure requires that you have HP Web Jetadmin Version 7.0 or later installed (see HP Web Jetadmin). Complete the following steps to update a single device through HP Web Jetadmin after downloading the .RFU file from the HP Web site.

1. Start HP Web Jetadmin.
3. Expand the Device Lists folder and select All Devices. Locate the digital sender that you want to update in the list of devices, and then click to select it.
4. Locate the drop-down box for Device Tools in the upper-right corner of the window. Select Update Printer Firmware from the action list.
5. Click Browse under Upload New Firmware Image and navigate to the location of the .RFU file that you downloaded from the Web at the start of this procedure. Select the file.
6. Click Upload to move the .RFU file to the correct location on the HP Web Jetadmin server. After the upload is complete, the browser window refreshes.
7. Select the new .RFU date code from the Select New Firmware Version drop-down menu.
8. Click Update Firmware Now. HP Web Jetadmin sends the selected .RFU file to the device. The digital-sender control panel shows messages that indicate the progress of the upgrade. At the end of the upgrade process, the digital sender restarts the firmware.

Upgrading the HP Jetdirect Inside firmware

The HP Jetdirect Inside network interface in the device has firmware that can be upgraded separately from the digital-sender firmware. This procedure requires that you have HP Web Jetadmin Version 6.2 or greater installed (see HP Web Jetadmin). Complete the following steps to update the HP Jetdirect firmware with HP Web Jetadmin.

1. Open the Web Jetadmin program.
3. Select the device that you want to update.
4. In the Device Tools drop-down list, select Jetdirect Firmware Update.
5. Under Jetdirect firmware version the Jetdirect model number and current firmware version are listed. Make a note of these.
7. Scroll down to the list of Jetdirect model numbers and find the model number that you wrote down.
8. Look at the current firmware version for the model, and see if it is later than the version that you wrote down. If it is, right-click on the firmware link, following the instructions on the Web page to download the new firmware file. The file must be saved into <drive>: \PROGRAM FILES\HP WEB JETADMIN\DOC\PLUGINS\HPWJA\FIRMWARE \JETDIRECT on the computer that is running the HP Web Jetadmin software.
9. In Web Jetadmin, return to the main device list and select the digital sender again.

10. In the **Device Tools** drop-down list, select **Jetdirect Firmware Update** again.

11. On the Jetdirect firmware page, the new firmware version appears under **Jetdirect Firmware Available on HP Web Jetadmin**. Click the **Update Firmware Now** button to update the Jetdirect firmware.

---

**Maintaining the hardware**

Maintaining the digital sender can include cleaning, replacing parts, and calibrating the digital-sender scanner.

**Cleaning the digital sender**

To maintain the scan quality, clean the device only if the ADF or glass is visibly marked or dirty, or if you are experiencing a decrease in the scan quality (such as streaking). Clean the outside of the device with a water-dampened cloth. Clean the inside with only a dry, lint-free cloth. Observe all warnings and cautions in the following cleaning tasks.

**To clean the glass**

- Clean the glass only if dirt is visible, or if you see poor scan quality (such as streaking).
- Clean the glass surface by wiping it gently with a clean, damp, lint-free cloth. Use an ammonia-based surface cleaner to dampen the cloth.

**CAUTION**

Do not pour or spray liquids directly onto the glass. Do not press hard on the glass surface, as this could break the glass.

**To clean the touchscreen**

Clean the touchscreen when needed to clear away fingerprints or dust build-up. To clean it, wipe the touchscreen gently with a clean, water-dampened, lint-free cloth.

**CAUTION**

Use water only. Solvents or cleaners can damage the touchscreen. Do not pour or spray water directly onto the touchscreen.
To clean the ADF delivery system

1. Lift the top part of the digital sender.

2. Locate the white, vinyl ADF backing.

3. Locate the white, vinyl calibration strips.

4. Clean the ADF backing and the calibration strips by wiping them with a clean, damp, lint-free cloth. Use an ammonia-based surface cleaner to dampen the cloth.

5. Close the top of the digital sender.
To clean the ADF rollers

You should clean the rollers in the ADF if you are experiencing misfeeds or if your originals show marks as they exit the ADF.

**CAUTION**

Cleaning the rollers too frequently could introduce dust into the device.

1. Open the ADF.

![Open ADF](image)

2. Locate the rollers near the vinyl calibration strips.

![Rollers](image)

3. Wipe the rollers gently with a clean, water-dampened, lint-free cloth.

**CAUTION**

Do not pour water directly onto the rollers. Doing so might damage the device.

4. Close the ADF.

![Close ADF](image)

5. Push the release button to open the ADF cover.

![Open ADF Cover](image)
6. Locate the rollers.

7. Wipe the rollers with a clean, water-dampened, lint-free cloth.

**CAUTION**
Do not pour water directly onto the rollers. Doing so might damage the device.

8. Locate the separation pad.

9. Wipe the pad with a clean, water-dampened, lint-free cloth.

10. Close the ADF cover.

**Replacing the mylar sheet**

If you start to see vertical streaks on the scanned images, as shown in the figure below, you might need to replace the mylar sheet at the base of the ADF. The device ships with an envelope containing three extra mylar sheets and installation instructions. The envelope is in a pocket behind the ADF vinyl backing, as shown in the following figure.
Follow the instructions that come in the envelope to replace the mylar sheet.

NOTE

If necessary, you can order extra mylar sheet replacement kits from your HP sales representative. The HP part number is Q6496A.

Diagnostics

Diagnostic tests can be run from the control panel to validate the hardware operation.

LED test

Follow these instructions to test the functionality of the control-panel LEDs.

1. Press the MENU button on the control panel and select the DIAGNOSTICS menu.
2. Select CONTROL PANEL, and then select the LEDs test. The LEDs test turns each LED on and off in order to verify its functionality.

Display test

Follow these instructions to test the functionality of the control-panel display.

1. Press the MENU button on the control panel and select the DIAGNOSTICS menu.
2. Select CONTROL PANEL, and then select the DISPLAY test. The display test shows test patterns on the control-panel display.

Buttons test

Follow these instructions to test the functionality of the control-panel buttons.

1. Press the MENU button on the control panel and select the DIAGNOSTICS menu.
2. Select CONTROL PANEL, and then select the BUTTONS test. The buttons test asks you to press each control-panel button to test its functionality.
**Touchscreen test**

Follow these instructions to test the functionality of the control-panel touchscreen.

1. Press the **MENU** button on the control panel and touch the **DIAGNOSTICS** menu.
2. Touch **CONTROL PANEL**, and then touch **TOUCHSCREEN**. The touchscreen test divides the screen into a grid and then asks you to touch each section of the grid to test its functionality.

**Calibrating the scanner**

The purpose of the scanner calibration process is to compensate for offsets in the scanner imaging system (carriage head) for ADF and flatbed scans. Because of mechanical tolerances, the scanner carriage head might not read the position of the image accurately. During the calibration procedure, scanner offset values are calculated and stored. The offset values are subsequently used when producing scans so that the correct portion of the scanned image is obtained by either adding or subtracting the number of pixels that are indicated in the offset from the lines or rows of the image.

Scanner calibration should only be carried out if you notice offset problems with the scanned images. The scanner is calibrated before it leaves the factory and normally should not need to be calibrated again.

Before calibrating the scanner, you must print the calibration target on a printer.

**To print the calibration target**

1. Go to the [http://www.hp.com/go/9200c_scanner_cal](http://www.hp.com/go/9200c_scanner_cal) Web page and follow the instructions to download the calibration target. The calibration target file is also available on the documentation CD-ROM that came with the device. The file name is CALIBRATION.PDF.
2. Print the target on any HP LaserJet printer or another available, laser-quality printer.
   a. Place letter or A4 paper in tray 1 (or the multipurpose tray) and adjust the side guides.
   b. Print the first pass of the calibration target.
   c. Return the first pass of the calibration target to tray 1 so that the arrows are facing into the printer.
d. Print the second pass. The final calibration target must look like the following figure.

![Calibration Target Diagram]

**CAUTION**

If the calibration target does not look like the figure shown here, the calibration process will fail and the quality of the digital-sender scans will be degraded. The black areas must extend completely to the edges of the page. If they do not, use a black magic marker to extend the black areas to the edges of the page.

If you have problems printing the calibration target, try using a different printer.

**To calibrate the scanner**

1. Take the calibration target to the digital sender.
2. Place it into the scanner ADF face-up and adjust the side guides.
3. Press the **MENU** button and touch **DIAGNOSTICS**, and then touch **CALIBRATE SCANNER**.
4. After the calibration target has passed through the ADF once, reposition it in the ADF in the opposite direction. After the second pass, the calibration is complete.

**The ADF Maintenance Kit**

The device notifies you when it is time to replace the ADF Maintenance Kit by showing a message on the control-panel display. You can view the remaining life of the Maintenance Kit at any time by pressing the **STATUS** button on the control panel or visiting the EWS Supplies Status page (see Information pages). Order Part Number Q5997A when you need to install a new ADF Maintenance Kit.

The ADF Maintenance Kit includes the following items:
- One pick-up roller assembly
- One separation pad
- One mylar sheet kit
- An instruction booklet

Follow the instructions that come with the kit to install it.

After replacing the kit, set the **NEW DOCUMENT FEEDER KIT** setting in the control-panel **RESETS** menu to **YES**.
Use the information in the following sections to troubleshoot specific problems with the digital sender.

**Jams**

To avoid jams in the ADF, use the following instructions.

**Avoiding jams**

Use the following information to avoid jams when using the ADF.

- When loading paper into the ADF, ensure that the paper stack is square and straight and the paper guides are adjusted to the width of the page to be scanned.
- Do not overload the ADF. The ADF was designed to hold 50 sheets of 75 g/m² (20 lb) bond paper.
- If the paper to be scanned using the ADF was previously folded, flatten it to the best of your ability. Try to remove all wrinkles and folds from the paper.
- If the paper to be scanned using the ADF was previously stapled, it might be necessary to “fan” the corner of the page where the staple was inserted. Often, the hole that the staple created makes the pages stick together (that is, interlocks the pages).
• Remove any stick-on notes or labels that are affixed to the pages being scanned. If the labels have deposited excessive residual adhesive to the paper, you might have to clean it off the paper before it is sent through the ADF.

• Paper that has been three-hole punched, been removed from a wire-comb or plastic comb binding, or has perforations might be difficult to send through the ADF.

• If the leading edge of the page to be scanned is excessively worn or frayed, try rotating the paper before scanning.

• Paper can acclimatize to the environment around it. If the operating environment is excessively dry, the paper might become dry and subject to static electricity. Excessively dry sheets of paper tend to stick together, which might lead to difficulty when feeding through the ADF.

Clearing jams

Follow these instructions to clear paper jams in the digital-sender ADF.

1. Press the release button to open the ADF cover.

2. Remove any jammed media from this area.

3. Make sure that you have removed all of the pieces of torn media.

4. Close the ADF cover.
## Operational issues

**Windows event log error messages**

The following table lists and explains the Windows event log messages generated by HP DSS running on the Windows server computer. If the problem persists, contact an authorized HP dealer.

The event log, available through Microsoft's Event Viewer, lets you monitor events in the Windows operating system that are related to digital sending. The event log service starts automatically when you start the HP DSS server computer. Follow these instructions to reach the event log.

1. From the HP DSS server, click **Start** and then point to **Settings**.
2. Click **Control Panel**, click **Administrative Tools**.
3. Click **Event Viewer**, then view the system log.

● Restart HP DSS. |
| DSS v. x.x - Address Book Error | An internal problem gaining access to address books has occurred.  
● Restart HP DSS. |

Troubleshooting SMTP and LDAP servers

During the configuration of the HP DSS program, you must locate the SMTP server and LDAP server on your network and test them to make sure they are functional. On most standard networks, using the Find Servers and Test buttons in the HP MFP DSS Configuration Utility will successfully find and test the servers. (See To add SMTP servers and LDAP Configuration.) However, in some cases, the discovery process might fail to find the SMTP or LDAP server. If this is the case, use the instructions in the following sections to find and test the server.

Finding the LDAP server address

The LDAP "Find Servers" function searches the network by querying DNS servers and MFPs that have been configured for LDAP. Servers that can provide LDAP functionality include e-mail servers and directory servers such as the following:

● Microsoft Exchange 5.5 and Exchange 2000 servers  
● Microsoft Active Directory servers  
● Novell Directory Services servers.

If you have one of these types of servers on your network and know the address, try typing it into the LDAP Server text box on the Authentication tab. Then click the Find Settings button to retrieve the settings.
Verifying an LDAP address

Use this procedure to verify that the LDAP server address you are using is valid.

1. Open a Web browser.
2. Type `LDAP://[hostname or IP address of LDAP server]` into the browser address box, using the host name or IP address of the LDAP server you are using for digital sending.
3. Press Enter. If the Find People dialog box appears, the LDAP server address is valid. If the dialog box does not appear, contact your network administrator to verify that the server is functioning.

Troubleshooting the LDAP Find Settings process

When you click the Find Settings button on the Authentication tab, the program uses the entries in the Accessing the LDAP Server and Searching the Database sections of the tab to find the correct settings for your LDAP server. Setting or changing these entries can affect the success of the Find Settings process. Try the following settings:

1. Select Anonymous from the LDAP Server Bind Method drop-down list, and then delete any data from the Search Root text box so that it is blank.
2. Click Find Settings.
3. Click Test and type a user name and password to test the software's ability to retrieve an e-mail address. If the test succeeds, your LDAP configuration is complete. If the test fails, continue on to Step 4.
4. Select Simple or Windows Negotiated (SPNEGO) from the LDAP Server Bind Method drop-down list. Select Use MFP user's credentials.

**NOTE**
If you are troubleshooting LDAP settings on the Addressing tab, or in the Configure MFP Addressing settings, the options displayed are slightly different. If you use the Simple or Windows Negotiated bind method, you must specify a username and password.

5. Click Find Settings.
6. Click Test and type a user name and password to test the software's ability to retrieve an e-mail address. If the test succeeds, your LDAP configuration is complete. If the test fails, consult with your network administrator.

**NOTE**
The attributes in the Find MFP user in database section of the Authentication tab match what the user types in at the device control panel to a unique user record in the LDAP database. You can select Exchange 5.5 Defaults or Active Directory Defaults from the MFP user information retrieval drop-down list to use the default settings for these server types. You must have some knowledge of the LDAP database structure in order to use the Custom option. If the Custom option is selected, you can either type in or select an entry in the Using the LDAP attribute of... field. This must correspond to what is selected in the match the MFP user login ID... field below it.
Finding an SMTP server address

The SMTP "Find Servers" function queries the DNS server for the "Mail Exchanger (MX)" record. If the Find Servers process fails, try the following:

1. Verify that the HP DSS server has obtained valid DNS settings by typing `ipconfig /all` at a command prompt.

2. If the `ipconfig` command returns valid DNS settings, ping the DNS server address to verify communication with the server. For example, type `ping 10.0.0.2` at a command prompt, where 10.0.0.2 is the IP address of the DNS server.

If these two tests succeed, you should have a valid SMTP server. Use the Add button on the E-mail tab to specify the host name or IP address of the SMTP server, then use the Test button to test the server.

If the Test process fails, verify that you have specified the correct SMTP server address. If you have specified the correct address, use a ping command to verify communication with the server. For example, type `ping 10.0.0.2` at a command prompt, where 10.0.0.2 is the IP address of the SMTP server. If the ping command fails, contact your network or mail administrator to verify network and SMTP server functionality.

Verifying an SMTP address

Use this procedure to verify that the SMTP server address you are using is valid.

1. Click Start and then Run and then type `CMD` into the Open text box to open a command prompt.

2. Type `Telnet [hostname or IP address of SMTP server] 25`, using the hostname or IP address of the SMTP server you are using for digital sending.

3. Press Enter. You should see something similar to the following:

   220 samplemail.hp.com ESMTP Server <Microsoft Exchange Internet Mail Service 5.5> ready. If you see this, the SMTP server address is valid. If you do not see this message, contact your network or mail administrator to verify that the server is functioning.
The LEDs on the digital-sender formatter board and on the HP Jetdirect network port can help troubleshoot problems.

1 Network port LEDs
2 Formatter LED

Use the green LEDs on the network interface card to confirm that the interface card is correctly connected to the network and that the network connection is active. Either the 10 Mbps or 100 Mbps LED should be on.

The formatter LED should blink at a steady rate of one blink per second. If it is not blinking, this indicates a serious error. Turn the device off and then back on again, and look for error messages on the control-panel display. If the problem persists, contact an HP-authorized service or support provider. (See the HP support flyer or go to http://www.hp.com/support/9200c.)
Hewlett-Packard limited warranty statement for hardware

HP PRODUCT
HP 9200C Digital Sender

DURATION OF LIMITED WARRANTY
1 year, Onsite service

HP warrants to you, the end-user customer, that HP hardware and accessories will be free from defects in materials and workmanship after the date of purchase, for the period specified above. If HP receives notice of such defects during the warranty period, HP will, at its option, either repair or replace products which prove to be defective. Replacement products might be either new or equivalent in performance to new.

HP warrants to you that HP software will not fail to execute its programming instructions after the date of purchase, for the period specified above, due to defects in material and workmanship when properly installed and used. If HP receives notice of such defects during the warranty period, HP will replace software which does not execute its programming instructions due to such defects.

HP does not warrant that the operation of HP products will be uninterrupted or error free. If HP is unable, within a reasonable time, to repair or replace any product to a condition as warranted, you will be entitled to a refund of the purchase price upon prompt return of the product.

HP products might contain remanufactured parts equivalent to new in performance or might have been subject to incidental use.

Warranty does not apply to defects resulting from (a) improper or inadequate maintenance or calibration, (b) software, interfacing, parts or supplies not supplied by HP, (c) unauthorized modification or misuse, (d) operation outside of the published environmental specifications for the product, or (e) improper site preparation or maintenance.

TO THE EXTENT ALLOWED BY LOCAL LAW, THE ABOVE WARRANTIES ARE EXCLUSIVE AND NO OTHER WARRANTY OR CONDITION, WHETHER WRITTEN OR ORAL, IS EXPRESSED OR IMPLIED AND HP SPECIFICALLY DISCLAIMS ANY IMPLIED WARRANTIES OR CONDITIONS OF MERCHANTABILITY, SATISFACTORY QUALITY, AND FITNESS FOR A PARTICULAR PURPOSE. Some countries/regions, states or provinces do not allow limitations on the duration of an implied warranty, so the above limitation or exclusion might not apply to you. This warranty gives you specific legal rights and you might also have other rights that vary from country/region to country/region, state to state, or province to province. HP’s limited warranty is valid in any country/region or locality where HP has a support presence for this product and where HP has marketed this product. The level of warranty service you receive might vary according to local standards. HP will not alter form, fit or function of the product to make it operate in a country/region for which it was never intended to function for legal or regulatory reasons.
TO THE EXTENT ALLOWED BY LOCAL LAW, THE REMEDIES IN THIS WARRANTY STATEMENT ARE YOUR SOLE AND EXCLUSIVE REMEDIES. EXCEPT AS INDICATED ABOVE, IN NO EVENT WILL HP OR ITS SUPPLIERS BE LIABLE FOR LOSS OF DATA OR FOR DIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL (INCLUDING LOST PROFIT OR DATA), OR OTHER DAMAGE, WHETHER BASED IN CONTRACT, TORT, OR OTHERWISE. Some countries/regions, states or provinces do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion might not apply to you.

THE WARRANTY TERMS CONTAINED IN THIS STATEMENT. EXCEPT TO THE EXTENT LAWFULLY PERMITTED, DO NOT EXCLUDE, RESTRICT OR MODIFY AND ARE IN ADDITION TO THE MANDATORY STATUTORY RIGHTS APPLICABLE TO THE SALE OF THIS PRODUCT TO YOU.

</tr>
</thead>
<tbody>
<tr>
<td>HP MFP DIGITAL SENDING SOFTWARE v. 4.0</td>
<td>90 days</td>
</tr>
</tbody>
</table>

1. HP warrants to you that the HP SOFTWARE PRODUCT will not fail to execute its programming instructions for 90 days after the date of purchase due to defects in material and workmanship when properly installed and used. If HP receives notice of such defects during the warranty period, HP will replace SOFTWARE PRODUCT media, which does not execute its programming instructions due to such defects.

2. HP does not warrant that the operation of HP products will be uninterrupted or error free. If HP is unable, within a reasonable time, to replace the SOFTWARE PRODUCT to a condition as warranted, HP may request that you uninstall the SOFTWARE PRODUCT and return it to HP for a refund.

3. ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE IS LIMITED TO THE DURATION OF THE EXPRESS WARRANTY SET FORTH ABOVE. Some states or provinces do not allow limitations on the duration of an implied warranty, so the above limitation or exclusion might not apply to you. This warranty gives you specific legal rights and you might also have other rights that vary from state to state, or province to province.

4. THE REMEDIES IN THIS WARRANTY STATEMENT ARE YOUR SOLE AND EXCLUSIVE REMEDIES. EXCEPT AS INDICATED ABOVE, IN NO EVENT WILL HP BE LIABLE FOR LOSS OF DATA OR FOR DIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL (INCLUDING LOST PROFIT), OR OTHER DAMAGE, WHETHER BASED IN CONTRACT, TORT, OR OTHERWISE. Some states or provinces do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you.

Note: The limited warranty for this product and accompanying software is located in the product documentation that you received with this product. Please review it at this time.

ATTENTION: USE OF THE SOFTWARE IS SUBJECT TO THE HP SOFTWARE LICENSE TERMS SET FORTH BELOW. USING THE SOFTWARE INDICATES YOUR ACCEPTANCE OF THESE LICENSE TERMS. IF YOU DO NOT ACCEPT THESE LICENSE TERMS, YOU MUST RETURN THE SOFTWARE FOR A FULL REFUND. IF THE SOFTWARE IS SUPPLIED WITH ANOTHER PRODUCT, YOU MAY RETURN THE ENTIRE UNUSED PRODUCT FOR A FULL REFUND.
Availability of support and service

Around the world, HP provides a variety of service and support options for purchase. Availability of these programs will vary depending upon your location.

HP maintenance agreements

HP has several types of maintenance agreements that meet a wide range of support needs. Maintenance agreements are not part of the standard warranty. Support services vary by location. Contact HP Customer Care to determine the services available to you and for more information about maintenance agreements. In general, the digital sender will have the following maintenance agreement:

**Next-Day Onsite Service**

This agreement provides support by the next working day following a service request. Extended coverage hours and extended travel beyond HP’s designated service zones are available on most on-site agreements (for additional charges).

²Configuration tested: Scanning simplex monochrome using ADF at 47 ppm and letter paper.
Regulatory information

Introduction

This section contains the following regulatory information:

- FCC regulations
- Environmental Product Stewardship program
- Declaration of conformity
- Canadian DOC statement
- EMI statement (Korea)
FCC regulations

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy. If this equipment is not installed and used in accordance with the instructions, it can cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation; the presence of interference can be determined by turning the equipment off and on. If this equipment does cause harmful interference to radio or television communications, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase distance between equipment and receiver.
- Connect equipment to an outlet on a circuit different from that to which the receiver is located.
- Consult your dealer or an experienced radio/television technician.

NOTE

Any changes or modifications to the device that are not expressly approved by HP could void the user's authority to operate this equipment.
Environmental Product Stewardship program

Protecting the environment

Hewlett-Packard Company is committed to providing quality products in an environmentally sound manner. This product has been designed with several attributes to minimize impacts on our environment.

Power consumption

Power usage drops significantly while in Sleep mode, which saves natural resources and saves money without affecting the high performance of this product.

Plastics

Plastic parts over 25 grams are marked according to international standards that enhance the ability to identify plastics for recycling purposes at the end of the product's life.

Materials and recycling information

Material restrictions

This HP product contains mercury in the fluorescent lamp of the control-panel liquid crystal display that can require special handling at end-of-life.

This HP product contains a lithium battery on the formatter board that can require special handling at end-of-life.

廃電池請回收

For recycling information, you can contact http://www.hp.com/recycle or contact your local authorities or the Electronics Industry Alliance: http://www.eiae.org.

For more information

To obtain information about environmental topics, including:

- the product environmental profile sheet for this and many related HP products
- HP’s commitment to the environment
- HP’s environmental management system
- HP’s end-of-life product return and recycling program
Declaration of conformity

Declaration of Conformity
according to ISO/IEC Guide 22 and EN 45014

Manufacturer's Name: Hewlett-Packard Company
Manufacturer's Address: 11311 Chinden Boulevard
Boise, Idaho 83714-1021, USA

declares, that the product

Product Name: HP Digital Sender 9200C
Regulatory Model Number3): BOISB-0401-00
Product Options: ALL

conforms to the following Product Specifications:

GB4943-2001

EN 61000-3-2:2000
EN 61000-3-3:1995/ A1
EN 55024:1998
FCC Title 47 CFR, Part 15 Class B2), ICES-003, Issue 4

Supplementary Information:

1) The product was tested in a typical configuration with Hewlett-Packard Personal Computer Systems. Compliance testing of product to standard with exception of Clause 9.5, which is not yet in effect.

2) This Device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device can not cause harmful interference, and (2) this device must accept any interference received, including interference that can cause undesired operation.

3) For regulatory purposes, this product is assigned a Regulatory model number. This number should not be confused with the product name or the product number(s).
