Index ............................................................................................................................................................. 49
Overview

The HP LaserJet Print Media Guide provides guidelines and troubleshooting information for print media to help optimize use of your HP LaserJet printer.

- How HP LaserJet printers work
- Other resources

HP LaserJet printers quickly and quietly produce documents of excellent print quality. Print media such as paper, envelopes, labels, and overhead transparencies can be used in your HP LaserJet printer. However, to ensure consistent performance and long-term reliability, the print media must be designed for use with laser printers. There are several types of high-quality print media available.

**NOTE:** Digital multimedia projectors are now the preferred technology for projecting images, resulting in a decline in use of overhead transparency (OHT) projectors. HP no longer produces overhead transparencies and does not perform extensive testing of overhead transparencies for its products. HP will verify that overhead transparencies designed for laser printers will not damage your HP LaserJet printer and will meet minimum performance requirements.

This manual provides guidelines for selecting and using print media to help you get the best performance from your HP LaserJet printer. It also contains information to help troubleshoot HP LaserJet printer problems that might be caused by poor-quality print media.

You might encounter some terms that are unfamiliar to you. For more information about these terms, see the Glossary on page 43.

The standards discussed in this manual do not apply to paper that is being scanned, copied, or faxed through the scan path on an HP LaserJet MFP (multifunction peripheral). Check the individual product manuals for that information.

**NOTE:** When HP LaserJet printers are discussed in this guide, the information pertains to HP Monochrome LaserJet printers, HP color LaserJet printers, and HP LaserJet MFPs unless otherwise noted. For specific information about what media your printer or MFP supports, see the documentation that came with your product.

How HP LaserJet printers work

The print process for HP LaserJet printers involves several steps.

HP LaserJet printers use laser and electrophotographic technologies to reproduce images and text on paper. On a laser printer, the print media is picked from the input tray one sheet at a time and transported through the paper path. While passing through the paper path, a scanning laser beam writes an electrostatic image onto a rotating photosensitive drum. As this image passes the developing station, a dry, powdery toner is attracted to the image areas. In an HP color LaserJet printer, this process is similar for each of the four toner colors.
The developed image then advances to the transfer station, where the drum contacts the paper or other print media and the toner image is electrostatically transferred onto the paper. After transfer, the print media passes through the fuser, where heat and pressure are applied and the toner fuses (melts) onto the print media. The print media is then delivered to the output bin, ready for use.

In summary, to create the printed image, the print media is transported through the printer, charged electrostatically, and heated. This is why print media properties such as cleanliness, electrical resistivity, caliper, finish, moisture content, and stiffness can affect the print quality and media-handling performance of your HP LaserJet printer.

Other resources

For assistance with your HP LaserJet printer or print media, you can consult other resources.

To determine if the print media is suitable for an HP LaserJet printer, check the media manufacturer's website for specifications. You can also check the specifications provided in this document and in the printer user guide.

Printing issues can have multiple causes. Switching to a different print media is often the quickest way to resolve issues with print quality and media transport. If you have tried the suggestions provided in this document and in the printer user guide, and you still need assistance, contact the dealer from whom you purchased the printer. You can also obtain support through the worldwide network of HP Sales and Service Offices. (See the sales and service listings in the HP LaserJet printer user guide.)

For more information about your HP printer and HP print media, see the HP website at http://www.hp.com.
Follow these guidelines for selecting print media that is most suitable for your HP LaserJet printer and any accessories.

- **Using print media**
- **Shipping and storing print media**

HP LaserJet printers are designed to use many types of print media, but it is advisable to use high-quality print media. HP paper is recommended for use in your HP LaserJet printer. See [Ordering HP print media on page 41](#).

HP LaserJet printers can use non-HP brand media that meets or exceeds the specifications for supported media. Using non-HP brand media that meets HP specifications should not damage the printer or void the warranty.

**NOTE:** Properties of non-HP brand media, over which HP has no control, are subject to change. The customer assumes all responsibility for the quality and performance of media. Although testing media helps to characterize its performance, long-term satisfaction requires manufacturer process-quality control as well as proper handling and storage by the customer.

If you are planning a large purchase of print media, it is important to test a small quantity of the media in the environment (temperature, humidity and application) in which it will be used.
Using print media

Understanding print media and following the HP recommendations will help to ensure proper operation of your HP LaserJet printer.

- Preparing print media for use
- Using paper
- Using envelopes
- Using labels
- Using overhead transparencies
- Printing on both sides of the paper

Preparing print media for use

Print media must be prepared properly before using it with your HP LaserJet printer.

Print media needs some time to stabilize in a new environment. To prepare print media, keep it in its protective packaging and store it in the environment in which it will be used. For small quantities, such as one or two reams, store the print media for one to two days. For larger quantities or if the change in the environment is significant, a week or more might be needed. For more information, see Environmental considerations on page 22.

⚠️ CAUTION: If print media is not prepared properly, the edges in the ream can become wavy or the sheets can curl soon after the package is opened, which can cause paper jams.
Using paper

Understanding the types and quality of paper and following the HP recommendations will help to ensure proper operation of your HP LaserJet printer and any accessories.

- Reading a ream label
- Opening and loading paper
- Setting the correct media type and size
- Paper types
- Guidelines for using paper

All papers are designed and manufactured for a specific use. Papers that are designed for the electrophotographic process, which laser printers and copy machines use, are typically called laser- or copier-grade papers. High-quality laser and copier papers are usually made from 100% chemical wood pulp and are characterized by a smooth surface, controlled electrical properties, heat stability, and cleanliness. These characteristics ensure good image transfer, fusing without excessive curl, and reliable printer operation.

**NOTE:** The current trend is to add higher quantities of filler to paper. Fillers are small particulates of things like calcium carbonate, clay, and talc. These particulates must be properly bound or sealed in the sheet during the paper-making process to prevent them from "dusting off" and contaminating the printer. For more information, see the definition of coated paper in Paper types on page 8.

Some print jobs require a paper that has a more prestigious look or feel. For example, letterhead papers generally have a watermark and often use cotton fiber. These papers tend to have a rougher surface, and their properties might not be controlled as well as those of photocopier papers. Poor toner adhesion and poor print quality can occur if the paper roughness is excessive. Different print settings might be required to print on these media. If poor print quality occurs, try another media to determine if the media or the printer is at fault.

Paper manufacturers make premium laser-grade bond papers that are optimized for laser printing.

**NOTE:** For print quality issues, see Troubleshooting print media problems on page 25.

Reading a ream label

The ream label identifies the characteristics of the paper.

A ream label is typically placed or printed on the outside of the paper wrapping. The ream label should list the weight, size, quantity of sheets, grain direction, and other information. The preferred side for printing might also be indicated by an arrow on the ream label, although some manufacturers do not specify a print side. If a preferred side is indicated, the paper should be loaded into the printer so that the preferred side will be printed (or printed first for duplexing). The preferred side might face up or face down in the input tray, depending on the printer model and the input source. (See the support documentation for your printer model to determine the orientation in the input tray.)

The following illustration shows an example of a ream label. For more information about the items on the label, see the Glossary on page 43.
Opening and loading paper

Follow this process when you open paper and load it into the printer input tray.

1. Place the wrapped ream of paper on a flat surface, with the seam side up.

2. Read the ream label that is located on the outside of the paper wrapping and note the direction of the arrow that indicates the preferred print side (if one is included). See Reading a ream label on page 5.

3. Open the paper wrapping and inspect for any damage to the sheets such as bent corners, wrinkles, nicked edges, or glue contamination. Discard any damaged sheets.

4. Before loading the paper into the tray, flex the stack in both directions.

- **A4 printer**: Letter/A4 media is fed short edge first, so grasp the media along the short edge and flex it back and forth.
- **A3 printer**: Letter/A4 media is fed long edge first, so grasp the media along the long edge and flex it back and forth.

![Image showing media handling](image)

**NOTE**: Do not fan or separate the paper into several stacks. Doing so creates air pockets between the sheets that can cause jams or multiple-sheet feeds.

### Setting the correct media type and size

To ensure optimal performance, it is critical to set the correct media type and size.

Not all HP LaserJet printers have media width and length sensors. If the incorrect size is specified, this can cause printer jams or result in error codes. Also, not all HP LaserJet printers have media sensors to properly adjust the print speed, fusing temperature, and transfer bias. This can result in poor print quality such as flaking toner or light prints.

A list of common media sizes and types follows. For more information, see [Specifications on page 35](#) or consult the user guide for your product.

**Common media sizes:**
- Letter
- Legal
- A4
- A3
- B5

**Common media types:**
- Plain
- Letterhead
- Bond
- Heavy
- Preprinted
Paper types

Several types of paper are available.

- Archival paper
- Bond paper or letterhead
- Coated paper
- Colored paper
- Copier paper (plain paper)
- Embossed and debossed paper
- Glossy paper
- Heavy paper, cover paper, and cardstock
- Laser paper
- Preprinted forms and letterhead
- Recycled paper
- Special print media

Archival paper

Paper that is used for archiving must meet the same specifications as standard paper with a pH greater than 7.0. Some archival demands are more stringent than others, requiring a specific degree of alkalinity and chemical stability. Toner is chemically stable and should last as long as the paper does. Toner can be degraded by petroleum-based solvents or plasticizers, such as those found in vinyl folders.

**NOTE:** There are no universal standards for what constitutes archival paper, but there are some generally accepted properties. Archival paper should be acid free, should not contain groundwood or unbleached pulp, should meet strict limits on metallic content, and should be free of optical brighteners that artificially make the paper whiter. For more information, see [https://www.strathmoreartist.com/blog-reader/what-is-the-difference-between-acid-free-and-archival.html](https://www.strathmoreartist.com/blog-reader/what-is-the-difference-between-acid-free-and-archival.html).

Avoid folding archival documents across printed areas or handling archival documents roughly. Discuss archival requirements with your paper supplier.

Bond paper or letterhead

Bond paper or letterhead is premium paper that is often watermarked, sometimes uses cotton fiber, and is available in a wide range of colors and finishes with matching envelopes. Many manufacturers now design these grades of paper with properties optimized for laser printing and advertise the paper as laser compatible or laser guaranteed. Some of the rougher surface finishes, such as cockle, laid, or linen, might require the special fuser modes that are available on some printer models in order to achieve adequate toner adhesion. For more information about your printer specifications, see [https://support.hp.com/us-en/products/](https://support.hp.com/us-en/products/).

Coated paper

Clay- or other pigment-coated papers must be specifically designed for laser printers. The electrical properties must be controlled and the surface designed not to blister during fusing. The coating must not flake or shed particles that can contaminate the printer.
Some preprinted media contains a specially prepared starch called press powder to assist the press operator in the printing process. If you are using preprinted media and there is excessive dusting, contact your supplier to determine if the product contains press powder. If so, request a press-powder-free version of the product.

Colored paper

You can use colored paper in your HP LaserJet printer if the paper meets the same specifications as standard paper. See Guidelines for using paper on page 11.

Print quality from the HP color LaserJet printers is optimal when printing on white paper. You also can use an HP color LaserJet printer to print on colored paper that meets all of the specifications that are listed in this guide. However, colored paper can change the appearance of the printed colors. This is because HP color LaserJet printers create colors by printing a pattern of dots, overlaying and varying their spacing to produce various colors. When these colors are printed on colored media, the shade or color of the media will vary the shades of your printed colors. Because the printer cannot sense the color of the paper that you are using, it cannot adjust the output colors for colored paper. To manually adjust the output colors, see the support documentation for your printer.

Copier paper (plain paper)

Although copier paper is often referred to as “plain,” the paper is optimized to work well with the electrophotographic process that is used in photocopiers and laser printers. Copier-grade paper commands the largest volume for printing and copying, and can be relatively inexpensive. However, keep in mind that the quality and consistency of paper can vary depending on the materials, processes, and controls that the manufacturer uses. These variations can significantly affect the quality of the printed output.

A very inexpensive paper might not save you money if it frequently causes multiple-sheet feeds or jams, or if it causes print-quality problems. If you are having these types of problems, you might want to consider using a different paper type or brand.

Embossed and debossed paper

Avoid heavily embossed or debossed papers to prevent multiple-sheet feeding that results from nesting. To prevent poor print quality and fusing (toner adhesion), do not print closer than 15 mm (0.59 inch) from the embossment. The heat of the fuser tends to flatten the embossed or debossed images.

NOTE: Embossed media that is pastelled or that has a metallic or shiny coating can be conductive and cause damage to the printer.

Glossy paper

Glossy paper that is designed for color laser printers creates vibrant photo images and graphics. With other types of glossy paper, the top coating might blister and there might be poor toner adhesion due to steam release during fusing.

Heavy paper, cover paper, cardstock, and postcards

Heavy paper generally refers to paper that is greater than 105 g/m² in weight (heavier than 28-lb bond) and cardstock generally refers to paper that is greater than 163 g/m² in weight (heavier than 60-lb cover, or 90-lb index). The heavier weight of these papers gives them more stiffness, which can degrade feeding reliability (typically as a result of poor pickup from the input tray). Using short-grain heavy paper in printers that feed in the portrait direction might help to avoid feed problems, because the paper is less stiff in the short-grain direction. Also, using the straightest paper path in your printer might also improve feeding reliability and print quality.
Heavy paper and cardstock might require higher fuser temperatures to adequately anchor the toner to the surface. Using the printer menu to select the paper type ensures that the appropriate fuser temperature will be used.

**NOTE:**
- Small form factor cardstock (in particular, preprinted, such as postcards) can cause jamming and missed picks. If the feed rotation of 90 degrees does not resolve the problem, then the media might not be compatible with the printer.
- Print postcards from tray 1 unless your product specifies to print from tray 2. If a jam occurs due to postcard curl, flip the postcard over.
- If your printer has a face-up printer bin, print from that. It provides a straight-through paper path.

**CAUTION:** Different HP LaserJet printer models and their input trays support various ranges of paper weights. Some models provide optimized settings that are available in the printer driver or at the control panel. Please see the support documentation that came with your HP LaserJet printer for specific information about its capabilities and settings.

**Laser paper**

Laser paper is another premium-quality paper grade that is typically characterized by very smooth and uniform surfaces, excellent formation, heavier bond weights of 24 lb or 32 lb, and very high brightness and whiteness. These optimized properties can enhance color and monochrome halftone reproductions by providing a very uniform substrate for image transfer and fusing.

**Preprinted forms and letterhead**

To avoid problems when using preprinted forms, embossed paper, and letterhead paper, observe the following guidelines:
- Avoid using low-temperature inks (the kind used with some types of thermography).
- Use forms and letterhead paper that have been printed by offset lithography or engraving.
- Use forms that have been created with heat-resistant inks that will not melt, vaporize, or release undesirable emissions when heated to 205°C (401°F) for 0.1 second (0.2 second for HP color LaserJet printers). Typically, oxidation-set or oil-based inks meet this requirement.
- Maintain the moisture content of preprinted forms by sealing them in moisture-proof wrap and storing them in a cool, dry location. Do not use materials that change the paper’s electrical or handling properties.
- Avoid processing preprinted forms that have a finish or coating.
- Avoid using heavily embossed or raised-letterhead papers.
- Avoid papers that have heavily textured surfaces.
- Avoid using offset powders or other materials that prevent printed forms from sticking together.

**Recycled paper**

Recycled paper is a combination of unused fibers and pre- and post-consumer waste paper. Printed waste paper is usually washed to remove most of the inks and other contaminants. A recycled sheet of paper might contain dark specks or appear gray or dirty. Choose recycled paper that meets the same specifications as standard paper (see Guidelines for using paper on page 11) and that has a suitable appearance for your needs. HP recommends that recycled paper contain no more than 30% post-consumer product. HP has tested a variety of
recycled copier papers on HP LaserJet printers and has found that they perform similarly to virgin-fiber grades. However, there can be higher jam rates in humid environments.

**Special print media**

Paper that undergoes converting processes before it is used in your laser printer must be properly designed and manufactured to ensure acceptable performance. Converting processes include preprinting, engraving, die-cutting, perforating, folding, gluing, embossing, and debossing. Because these processes use many different inks, materials, tools, and techniques, HP recommends that you make sure your converter or supplier knows that the media will be used in a laser printer. Ask for a guarantee of acceptable performance.

Examples of special print media are paper label combinations, plastic paper combinations, self-sealing media, tear-resistant media, 100% synthetic media, business card media, hospital multicomponent media, and blank embossed certificates.

Media that has perforations or cutouts can be printed successfully on your HP LaserJet printer, but it must be properly designed and manufactured to avoid feed or contamination problems and to prevent wear on the printer. Perforations or cutouts must not affect the media’s flatness, stiffness, or be large enough to interact with adjacent sheets in a stack. Misfeeds and loose, unfused toner can affect the print quality.

- **Cutout**: The area where material has been removed by punching or die-cutting. Cutouts can interact with paper-path sensors or can result in contamination from toner if printing is too close to a cutout location.

- **Perforations**: A series of holes or slits in media that provide a controlled tear for separating one portion of the sheet from another. HP recommends that micro-perforations be used, because they provide better strength and reduce nesting, debris, and dusting.

Consider the following guidelines when working with a knowledgeable vendor to develop media with perforations or die-cuts:

- Punch cutouts and perforations from the side to be printed. This prevents edge trimmings from scratching the photosensitive drum.

- Round all corners of a cutout to prevent snagging or, in the case of labels, peeling.

- Ensure that die-cutting of labels does not penetrate the liner sheet.

- Ensure that cutouts are not made at a position where paper-path sensors are located.

- All cuts should be clean (no burrs) and free of edge rollover to prevent nesting, poor feeding, contamination, or wear on the printer.

- Orient perforations in the direction of paper feeding to minimize tenting or feeding problems from reduced stiffness.

- Do not run perforations closer than 2 mm (0.08 inch) from the paper edge or 25 mm (1 inch) from the leading edge, or jamming and feeding problems can result.

**Guidelines for using paper**

Follow these guidelines for using paper to ensure optimal performance.

For most printing, use conventional white laser-printer paper. It must be high-quality paper that is free of the following defects:

- Cuts
- Tears
- Grease spots
- Loose particles
- Dust
- Wrinkles and voids
- Curled or bent edges

⚠️ CAUTION: Avoid using extremely heavy or light paper. Use paper that is within your printer’s specified basis-weight range, as indicated in the support documentation that came with the printer. To troubleshoot paper problems, see Paper problems on page 28.

The paper properties and specifications provided in this table generally apply to all HP LaserJet printers. See the support documentation that came with your printer for product-specific information.

Table 2-1 Paper properties and specifications

<table>
<thead>

Using envelopes

Understanding the types and quality of envelopes and following the HP recommendations will help to ensure proper operation of your HP LaserJet printer.

- **Envelope construction**
- **Summary of HP envelope testing**
- **Guidelines for using envelopes**

⚠️ **CAUTION:** Due to product designs, not all products support envelopes from all trays. Printing on envelopes can damage the printer. See the user guide that came with your printer for detailed instructions about printing on envelopes.

Most HP LaserJet printers can print on many sizes and styles of envelopes by using the manual feed feature, an optional envelope tray, an optional envelope feeder, or another tray. Whichever input method you use, envelopes should meet all of the specifications that are discussed in this document. Your envelope vendor should provide you with a satisfactory envelope that complies with the specifications listed in **Guidelines for using envelopes on page 16**. However, inconsistencies in folds or other process-control problems can result in some envelopes feeding well and others jamming. Purchase envelopes that have the quality and consistency that your printer requires.

⚠️ **NOTE:**

- Optional envelope feeders are specific to products and are not interchangeable. For more information, see your product user guide.
- Envelopes can meet the general specifications listed in **Guidelines for using envelopes on page 16** and still not print satisfactorily because of the printing environment or other variables over which HP has no control.

⚠️ **CAUTION:** Envelopes with windows, clasps, snaps, or a glued surface can cause severe damage to the printer. See the support documentation for your printer before using envelopes in your HP LaserJet printer.

**Envelope construction**

Because of their construction, some envelopes do not feed through the printer dependably. Observe these guidelines when purchasing and using envelopes.

- Make sure that the envelope's leading edge, which enters the printer first, is straight, with a sharp, well-creased fold that has no more than two thicknesses of paper. Envelopes that exceed 90-g/m² (24-lb) basis weight can cause jamming.
- Avoid using flimsy envelopes that have thick or curved leading edges; they will not feed reliably.
- Envelopes should lie flat and should not be wrinkled, nicked, or otherwise damaged.
- Avoid envelopes that have baggy construction; they might wrinkle while passing through the printer’s fuser area.
- Make sure that the adhesive labels and all other materials used on envelopes will not scorch, melt, offset, or release undesirable emissions when heated to 205°C (401°F) for 0.1 second (0.2 second for HP color LaserJet printers).
- Avoid using envelopes that have encapsulated adhesives that do not require moistening but instead use pressure for sealing.
- Do not use envelopes that have clasps, snaps, tie strings, transparent windows, holes, perforations, or cutouts.
- Do not use envelopes that have any adhesive surfaces exposed to the printer.
- Envelopes with woven or smooth finishes ensure good toner adhesion.
- Protect envelopes in humid environments. High moisture content can cause some envelopes to seal shut due to elevated temperatures when steam is released during fusing.

Many envelopes will feed through your HP LaserJet printer without problems. However, some envelope constructions (as shown in the following illustration) might not feed reliably. Problems can occur when the envelopes are folded more tightly than normal, which creates a thick leading edge near a corner. Inconsistencies in folding during manufacturing can cause some envelopes to feed well and others to jam. Purchase envelopes that have the quality and consistency that you require.

**NOTE:** For optimal print quality, make sure the paper type is set to envelope.

**Figure 2-2** Examples of good and bad envelope construction

**Good construction**

1. Diagonal-seam envelope
2. Double-sided seam envelope
3. Manila envelope

**Bad construction**

Inconsistent leading edge

---

**Summary of HP envelope testing**

HP tests many types of envelopes to determine which ones print acceptably in an HP LaserJet printer. This is a summary of the test results.
Commercial or Official envelopes (also called Business or Regular), which have diagonal seams and standard gummed flaps, performed the most reliably.

Envelopes that have double-sided seam construction, which creates vertical seams at both ends of the envelope instead of diagonal seams, tend to be more flimsy than diagonal-seam envelopes. Double-sided seam envelopes tend to jam or wrinkle unless the edges are thin and sharply creased. However, a variety of double-sided seam envelopes have performed acceptably during testing.

Envelopes that have a peel-off adhesive strip or that have more than one flap that folds over for sealing, must use adhesives compatible with the heat and pressure of the printer’s fusing process. Several varieties of this type of envelope performed satisfactorily in HP testing. However, the extra flaps and strips can result in increased jamming or wrinkling and poor toner adhesion due to the increased thickness of the envelope.

Generally, feeding problems increase with envelope size. Larger envelope sizes (C5, B5) cannot have a basis weight greater than 105 g/m² (28 lb).

Rougher finishes such as laid, linen, or cockle can result in poor fusing.

The multiple layers in envelopes construction might result in a noticeable background effect (small toner particles scattered in the non-imaged areas). You can reduce this effect by increasing the toner density setting on your printer.

When running very large envelope jobs (several hundred to thousands), the fuser life might be reduced due to accelerated wear.

The location of the envelope flap can cause feed problems. If the flap location is the same as the pick roller location (that is, the pick roller picks up the envelope by the flap), then the flap can move but the envelope cannot, causing a jam. In this situation, try rotating the envelope 180 degrees so you do not feed the envelope flap at the pick roller.

Guidelines for using envelopes

Follow these guidelines for using envelopes to ensure optimal performance.

The envelope properties and specifications provided in this table generally apply to all HP LaserJet printers. See the support documentation that came with your printer for product-specific information.

NOTE: For optimal results, print envelopes using the straightest paper path possible (for example, tray 1 to the face-up output bin).

</table>
| Dimensional accuracy and construction quality | Envelopes must be folded within ±1 mm (±0.04 inch) of nominal size and have no more than two thickness of paper anywhere along the leading edge.  
  All folds must be sharply creased and construction must be tight (not baggy) to avoid wrinkling.  
  Envelopes must not be stuck together from excess seam adhesive. The envelope flap must lie flat (within 1.5 mm [0.059 inch] over the width where the adhesive is applied). |
| Curl                                          | Envelopes must lie flat, with no more than 6 mm (0.25 inch) curl across the entire surface.                                                                 |
| Moisture content                              | 4% to 6% by weight.                                                                                                                             |
| High moisture content can cause some envelopes to seal shut due to elevated temperatures when steam is released during fusing. |
| Grain                                         | Different types of envelope construction might require different grain orientations for best performance, which is left to the discretion of the converter. For more information, see the support documentation that came with your printer. |
| Packaging                                     | Protective box to prevent edge damage and maintain flatness.                                                                                  |
Using labels

Understanding the types and quality of labels and following the HP recommendations will help to ensure proper operation of your HP LaserJet printer.

- Guidelines for using labels
- Recommendations for using labels

Labels are a type of multiple-layer media that typically consists of a face sheet (the printable surface), pressure-sensitive adhesive, and a liner (a carrier sheet coated with a release agent). Labels to be used in your HP LaserJet printer must be specifically designed for laser printers. If labels other than those compatible with laser printers are used, a significant risk exists for labels peeling or for adhesive contamination that can severely damage your printer. All materials in laser label stock must be compatible with the heat and pressure of the fusing process, and must not melt or release undesirable emissions when heated to 205°C (401°F) for 0.1 second (0.2 second for HP color LaserJet printers).

⚠️ CAUTION:

- The liner or release layer should not be exposed. Open spaces and gaps might trap toner and prevent it from fusing properly.
- Not all HP color LaserJet printers support printing on labels from all trays. Please see the support documentation that came with your product to determine if your product supports labels.

Guidelines for using labels

Follow these guidelines for using labels to ensure optimal performance.

The label properties and specifications provided in this table generally apply to all HP LaserJet printers. See the support documentation that came with your printer for product-specific information.

<table>
<thead>
<tr>
<th>Table 2-3</th>
<th>Label properties and specifications</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Property</strong></td>
<td><strong>Specifications</strong></td>
</tr>
<tr>
<td>Adhesives</td>
<td>Adhesives must not be on any external surfaces of the label before, during, or after printing. Label construction, adhesive release strength, and appropriate die-cutting must prevent labels from peeling off during printing. Different adhesives can provide removable, permanent, or semi-permanent fixation of the face sheet onto the item being labeled. Generally, acrylic-based adhesives are preferred for laser printing because they can be applied in very thin layers to prevent oozing and contamination, and can be made compatible with the heat and pressure of fusing. Improved processes are being developed to minimize adhesive contamination, such as zone coating or stripped matrix. Zone coating recesses the adhesive around the border of a die-cut, and stripped matrix prevents adhesive from oozing between the die-cut labels. The adhesive and liner must provide adequate release strength so that labels will not peel off during printing.</td>
</tr>
<tr>
<td>Caliper</td>
<td>The caliper must not exceed 0.23 mm (9.0 mils).</td>
</tr>
</tbody>
</table>
Table 2-3  Label properties and specifications (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Specifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>Face sheet</td>
<td>The face sheet is the printable surface on a sheet of adhesive labels and can be made from different materials, including paper, polyester, and vinyl. It is common for a face sheet to be die-cut so that individual shapes can be removed after printing. Polyester and vinyl labels require a topcoat to provide the proper electrical and toner adhesion properties. It is important to purchase labels from a knowledgeable converter who is familiar with these processes and laser printing.</td>
</tr>
<tr>
<td>Fusing compatibility</td>
<td>All inks, adhesives, and other materials that are used in the label construction must be compatible with the heat and pressure of the fusing process. Materials must not scorch, melt, ignite, offset materials, or release undesirable emissions when heated to 205°C (401°F) for 0.1 second (0.2 second for HP color LaserJet printers).</td>
</tr>
<tr>
<td>Liner</td>
<td>The liner is the carrier sheet for the label material. The liner must provide stability for the reliable pickup and transport of the label stock through the printer. <strong>CAUTION:</strong> The liner or release layer should not be exposed on the front. Open spaces and gaps might trap toner and prevent it from fusing properly.</td>
</tr>
<tr>
<td>Packaging</td>
<td>The labels should be delivered in moisture-proof wrap to preserve their properties.</td>
</tr>
<tr>
<td>Shelf life</td>
<td>The labels should have a minimum shelf life of one year, when stored at 23°C (73°F) and 50 percent relative humidity.</td>
</tr>
</tbody>
</table>

**Recommendations for using labels**

Follow these HP recommendations for using labels.

- Regularly inspect your labels after printing for any indication that the label edges are lifting or that adhesive contamination is occurring on the print surface. If either of these problems is observed, HP recommends that you discontinue use of that box or lot-number of labels and discuss the problem with your label supplier.

- If many sheets of labels are being continuously run, periodically run several sheets of paper through the printer to clean any contamination or label-stock adhesive that might have deposited.

⚠️ **CAUTION:** Be sure to run full sheets of labels. Reprinting unused portions can increase the risk of the labels peeling and the occurrence of adhesive contamination.
Using overhead transparencies

Understanding the types and quality of overhead transparencies and following the HP recommendations will help to ensure proper operation of your HP LaserJet printer.

- Guidelines for using overhead transparencies

**NOTE:** Digital multimedia projectors are now the preferred technology for projecting images, resulting in a decline in use of overhead transparency (OHT) projectors. HP no longer produces overhead transparencies and does not perform extensive testing of overhead transparencies for its products. HP will verify that overhead transparencies designed for laser printers will not damage your HP LaserJet printer and will meet minimum performance requirements.

Overhead transparency film must be designed specifically for use with laser printers. Photocopy transparency film might not be compatible with laser printers because of higher temperature and stiffness requirements. Color laser printers also require different film from that used in monochrome printers to ensure proper color reproduction and meet fusing requirements.

Overhead transparency film is very smooth and must have a topcoat to provide the proper electrical and toner adhesion properties. A transparency that is made of incompatible material or that is too thin can easily melt in or wrap around the fuser and damage your printer. The thickness requirement for monochrome overhead transparency film is 0.10 mm to 0.11 mm (4.0 mils to 4.4 mils). For color overhead transparency film, the thickness requirement is 0.12 mm to 0.13 mm (4.8 mils to 5.2 mils).

Overhead transparency materials must be able to withstand the heat and pressure of the fusing process. Materials must not discolor, offset, or release undesirable emissions when heated to 205°C (401°F) for 0.1 second (0.4 second for HP color LaserJet printers). See your HP LaserJet printer user guide for detailed instructions on using overhead transparencies.

**CAUTION:** Not all HP LaserJet printers support overhead transparencies. To determine if overhead transparencies are supported for your product, see the product user guide.

Guidelines for using overhead transparencies

Follow these guidelines for using overhead transparencies to ensure optimal performance.

The following table summarizes the overhead transparency properties and specifications.

**CAUTION:** To prevent jamming or poor-quality output, HP recommends using monochrome transparencies with HP LaserJet monochrome printers and color transparencies with HP color LaserJet printers.

**NOTE:** The specifications listed in this section generally apply to all HP LaserJet printers. See the support documentation that came with your printer for product-specific information.

---

**Printing on both sides of the paper**

Two-sided printing, also known as duplex printing or duplexing, can be an automatic or manual process.

**NOTE:** Consult your product user guide to determine the supported size, type, weight, and orientation for best results.

**Automatic duplexing**

Automatic duplexing requires an HP LaserJet printer that is designed especially for duplex printing. See the support documentation for your printer model or duplex accessory for information about supported paper.

⚠️ **CAUTION:** Duplexing on adhesive labels, envelopes, or overhead transparencies can damage your printer.

**Manual duplexing**

Manual duplex printing, in which sheets that have already been printed are fed again into the printer, requires operator intervention. For more information, see the software application support documentation.

**NOTE:** HP recommends manually refeeding sheets only through the manual feed slot, the multipurpose (MP) tray, or tray 1.
Shipping and storing print media

The performance of HP LaserJet printers depends on the condition of the print media that is used. Follow the HP recommendations for shipping and storing media and understand the environmental effects on media.

- **Environmental considerations**

**Shipping media**

When you are shipping print media through different environments, use plastic wrap to wrap all cartons on the shipping pallet. When you are shipping media across bodies of water, also wrap individual cartons. Packaging must protect the media from physical damage.

**Storing media**

Follow these guidelines when stacking and storing print media:

- Do not store cartons or reams directly on the floor. Place cartons on a pallet or on shelves.
- Do not store individual reams in a manner that will result in curling or warping.
- Rewrap and seal partially used packages of media before storing them.
- Do not stack more than six cartons on top of each other.
- Stack each carton squarely on top of the one underneath.
- Stack each carton upright.
- Do not place anything on top of media, regardless of whether the paper is packaged or unpackaged.
- Store envelopes in a protective box to avoid damaging the envelope edges.
- Avoid storing paper near direct sunlight (close to windows) or close to air-conditioned vents. This can cause damage to the paper over time.
- Do not store printed documents in vinyl folders (which can contain plasticizers) and do not expose the documents to petroleum-based solvents.

**Environmental considerations**

HP LaserJet printers are designed to operate in a wide range of environmental conditions.

For best performance, store and use media at 20°C to 24°C (68°F to 75°F), with a relative humidity of 45% to 55%. Follow these guidelines when media is used in an environment outside those temperature and humidity ranges:

- Do not expose the media to extremes in humidity or temperature. If media is left unwrapped or in the printer input tray, extreme changes in the environment will cause the media to assume unwanted characteristics.
- Historically, recycled media has been more susceptible to moisture changes, resulting in a higher jam rate. It is recommended that recycled media contain 30% or less of post-consumer content.
- In the case of extreme humidity, keep paper and envelopes tightly wrapped in plastic. High moisture content can cause some envelopes to seal shut due to elevated temperatures when steam is released during fusing.
If a significant temperature difference exists between the media storage area and the printer's operating environment, allow the media time to adjust to the temperature in the printer's operating environment before unwrapping it. The greater the temperature difference and the greater the amount of media to acclimate, the longer this time period should be. Allow one day for every 10°C (20°F) difference in temperature between the storage environment and the printing environment.
Problems with print quality and media handling typically result from print media that does not meet the specifications, that has been stored improperly, or that is not in good condition. This chapter explains the possible causes of and solutions to print media problems.

- Basic troubleshooting tasks
- Types of print media to avoid
- Paper problems
- Envelope problems
- Print-quality problems

Troubleshooting checklist

Ask the following questions to determine if the print media is causing print-quality problems:

- Does your media meet the specifications outlined in this document? (See Types of print media to avoid on page 26 and Guidelines for using print media on page 3.)
- Is the media in good condition? Is it curled or wrinkled?
- Are you using the printing procedures that are described in the printer user guide?
- Are you observing correct practices when handling and loading media? (See the support documentation for your printer for guidelines to load media.)
- Are your print-quality problems isolated to a specific type of media?
- Did you check the following aspects of the environment in which the printer operates or in which the print media is stored? (See Environmental considerations on page 22.)
  - Temperature
  - Humidity
  - Cleanliness

Basic troubleshooting tasks

If you cannot determine the cause of print defects by using the troubleshooting checklist, perform these basic troubleshooting tasks.
• Inspect the print media for obvious defects, such as torn sheets, contamination from glue, or ragged cut edges.

• Use print media from another lot or from a different manufacturer.

**NOTE:** If a print problem develops when using certain print media, switch to a known good print media, preferably HP branded.

• Turn the paper stack over in the input tray and/or turn it 180° in the tray. Alternatively, try using another tray.

• If you have a print-quality problem that is related to envelopes, print a sheet of paper to determine if the problem is caused by the variable thickness of your envelope.
  – If the print quality of the single-sheet sample is good, re-examine your envelope and see Envelope construction on page 14.
  – If the print quality of the single-sheet sample is poor, you might have a printer problem. See the support documentation for your printer to see further troubleshooting information.

• Read the remainder of this troubleshooting section for further troubleshooting information, perform the maintenance procedures that are recommended in your printer user guide, or see the troubleshooting section in your printer user guide.

## Types of print media to avoid

To ensure proper performance of your HP LaserJet printer, use paper or other print media specifically designed to work with your printer.

Avoid using print media with the following characteristics:

• Print media, media coatings, dyes, or inks that contain materials that melt, vaporize, offset, discolor, or release undesirable emissions when exposed to 205°C (401°F) for 0.1 second (0.2 second for HP color LaserJet printers).

• Print media that is very rough, highly textured, or heavily embossed.

• Multipart forms.

• Carbonless media.

• Print media that offsets or discolors.

• Print media that is damaged, curled, wrinkled, or irregularly shaped.

• Print media that has not been stored or shipped properly. (See Shipping and storing print media on page 22.)

• Overhead transparency film that produces undesirable emissions or melts when exposed to a fusing temperature of 205°C (401°F) for 0.1 second (0.4 second for HP color LaserJet printers). An example would be overhead transparencies that are designed for printing on an ink printer.

• Envelopes that have encapsulated adhesives that do not require moistening but instead use pressure for sealing.

• Envelopes that have clasps, snaps, tie strings, windows, or synthetic materials. These materials can severely damage the printer.
● Envelopes that are not square, straight, or constructed correctly. (See Envelope construction on page 14.)

● Envelopes of a basis weight less than 60 g/m² (16 lb) or greater than 105 g/m² (28 lb).

● Envelopes that have baggy construction or folds that are not sharply creased.
Paper problems

Common symptoms of paper-quality issues include a high occurrence of jams, multiple-sheet feeds, and paper curl.

- Frequent paper jams
- Frequent multiple-sheet feeds
- Reducing post-image curl

⚠️ **CAUTION:** Do not reuse jammed paper. Doing so can damage the printer.

Frequent paper jams

Frequent paper jams can have several possible causes and can be corrected by following the suggested actions.

💡 **NOTE:** To recover from a paper jam, follow the directions provided in the HP LaserJet printer user guide.

<table>
<thead>
<tr>
<th>Table 3-1 Paper jams: causes and corrective actions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cause</strong></td>
</tr>
</tbody>
</table>
| Paper is too stiff or heavy. Heavy or stiff paper might not be able to negotiate the paper path or be picked up from the input tray. | ● Make sure that the paper does not exceed the basis weight that is specified in the user documentation for your printer.  
● Feed from the multipurpose tray. See [Guidelines for using paper on page 11](#) to ensure that the media meets the requirements for bond weight and thickness.  
● Use the correct output bin, as shown in your printer user guide.  
● Use a lighter-weight paper. |
| Paper is too smooth or too rough. | Change the paper type or manually feed the paper into the printer.  
See your printer user guide for the correct output tray selection. |
| Paper is not cut to specification. This can cause poor print alignment, mis-stacking, improper fit in the input tray, or problems with the paper sensors. | Change the paper type or try another ream of paper. |
| Paper is too light or too flimsy. | Make sure that the paper meets the specifications that are listed for basis weight in [Guidelines for using paper on page 11](#). |
| Paper guides in the tray are set incorrectly in the printer. | Make sure that all of the paper guides have been set correctly. See the user documentation for your printer for more information. |
| Paper is too dry or too moist. | ● Make sure that the paper is not near a window or a heat or air vent.  
● Replace the paper in the unit with paper from a newly opened ream. |
| Paper might contain higher filler levels of talc and calcium carbonate. If the talc or calcium carbonate are not well-bound to the paper fibers, they can build up in the paper path and cause print quality (PQ) defects and frequent paper jams. | ● Try a different paper brand.  
● Perform the printer cleaning procedures that are appropriate for your printer. For most HP LaserJet printers you can use a cleaning page to remove build-up in the fuser. For more information, see the documentation that came with your printer. |
Frequent multiple-sheet feeds

Frequent multiple-sheet feeds can have several possible causes and can be corrected by following the suggested actions.

### Table 3-2  Frequent multiple-sheet feeds: causes and corrective actions

<table>
<thead>
<tr>
<th>Cause</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paper is added in small amounts to the input tray.</td>
<td>Add only full reams of paper to the input tray, and avoid mixing paper types in the input tray.</td>
</tr>
</tbody>
</table>
| Paper is too dry or is not moist enough. (Insufficient moisture makes paper less conductive and creates static buildup.) | ● Try another ream of paper.  
● Change the paper type.  
● Make sure that the paper is properly prepared. See Preparing print media for use on page 4. |
| Paper is too light or too thin.                                      | Change the paper type.                                                  |
| Paper is too smooth or too rough. Surfaces tend to interlock or stick together. | Change the paper type.                                                  |
| Paper is embossed or has raised letterhead.                         | Change the paper type.                                                  |
| Paper guides in the trays are set incorrectly.                      | Make sure that all of the paper guides have been set correctly. See the user documentation for your printer for more information. |
| Paper sticks together at the edges (edgeweld). Edgeweld is caused by the use of dull cutting blades during the manufacturing process. | ● Flex the stack in both directions to “break” any locked edges.  
● Try a different ream of paper.  
● Try a paper from a different paper manufacturer. |

Reducing post-image curl

When an HP LaserJet printer prints a sheet of paper, the sheet can develop a curvature that is called post-image curl. Generally, the higher the moisture content of the paper, the greater the curl.

Both the paper and the printer affect the amount of post-image curl. In the papermaking process, stresses that can cause curl are a result of the paper manufacturing process, so different papers will have differing amounts of post-image curl. In the printing process, the paper is subjected to the heat and pressure of the fuser as well as to the contours of the paper path.
### Table 3-3 Post-image curl: causes and corrective actions

<table>
<thead>
<tr>
<th>Cause</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paper is too moist, resulting in waviness or curl.</td>
<td>- Print to the another output bin, for example, the face-up output bin. (This option is not available with some printers.)&lt;br&gt;- Change to a different type or brand of paper.&lt;br&gt;- If possible, set the paper type to a lighter-weight paper. For more information, see the support documentation that came with your printer.&lt;br&gt;- You might need to acclimate the paper to your environment to diminish differences in heat and moisture. (See Preparing print media for use on page 4.)&lt;br&gt;- Follow the storage and handling specifications in this document. (See Shipping and storing print media on page 22.)</td>
</tr>
<tr>
<td>Paper orientation (direction in which the paper is fed into the printer) is incorrect, resulting in excessive curl.</td>
<td>- Turn the paper stack over or turn it around in the input tray to reverse the direction of the paper.&lt;br&gt;- The grain of the paper can affect the curl of the paper. Therefore, if you are feeding the paper in landscape mode and you are experiencing curl, try feeding the paper in portrait mode, if possible.</td>
</tr>
</tbody>
</table>
Envelope problems

Certain conditions can indicate envelope problems, such as high rates of jams, gray areas printing on envelopes, and wrinkling.

- **Frequent envelope jams**
- **Gray areas on envelopes**
- **Wrinkles on envelopes**

Frequent envelope jams

Frequent envelope jams can have several possible causes and can be corrected by following the suggested actions.

Overfilling the envelope tray and misadjusting its guides are the most common causes of jams. However, if the envelope tray is properly loaded, the envelopes might be causing the problems.

To recover from an envelope jam, follow the directions provided in the HP LaserJet printer user guide.

⚠️ **CAUTION:** Do not reuse jammed envelopes. Doing so can damage the printer.

### Table 3-4 Frequent envelope jams: causes and corrective actions

<table>
<thead>
<tr>
<th>Cause</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Envelopes are poorly manufactured.</td>
<td>• Make sure that the leading edge is straight, and has a sharp, well-creased fold. The envelope must not have more than two thicknesses of paper along any leading edge. The folded layers of paper should come to a point at the leading-edge corners. (See the figure in <strong>Envelope construction on page 14</strong>)</td>
</tr>
<tr>
<td>Envelopes are not creased sufficiently to have sharp edges.</td>
<td>• Purchase envelopes that are manufactured correctly, or run the side of a pen or pencil over the envelope edges to flatten them.</td>
</tr>
<tr>
<td>Envelopes are wrinkled, bent, or curled.</td>
<td>Crease the leading edge of the envelope with the side of a pen or pencil, or change to a different type or brand.</td>
</tr>
<tr>
<td>Envelopes are too stiff or heavy. Stiff or heavy envelopes cannot negotiate the paper path or be picked up from the envelope tray.</td>
<td>Make sure that the envelope's leading edge, which enters the printer first, is straight, and that it has a sharp, well-creased fold that has no more than two thicknesses of paper.</td>
</tr>
<tr>
<td>Envelopes are too smooth (do not have enough friction for transport) or too rough.</td>
<td>• Use a lighter-weight envelope. Do not exceed the basis weight of 105 g/m² (28 lb).</td>
</tr>
<tr>
<td>Envelopes are jamming on the flap because the flap is at the pick <strong>roller contact point.</strong></td>
<td>• Use the printer’s most direct (straight-through) paper path.</td>
</tr>
</tbody>
</table>

Gray areas on envelopes

Gray areas on envelopes have some possible causes and can be corrected by following the suggested actions.
Wrinkles on envelopes

Wrinkles that form on envelopes after printing have several possible causes and can be corrected by following the suggested actions.

Table 3-6 Wrinkles on envelopes: causes and corrective actions

<table>
<thead>
<tr>
<th>Cause</th>
<th>Actions</th>
</tr>

<td>Folds are not sharply creased.</td>
<td>Try different envelopes that are better constructed. See Envelope construction on page 14 for characteristics of good envelope construction.</td>
</tr>
<tr>
<td>Low-weight/low-strength paper used in the envelope construction.</td>
<td>Try different envelopes that are better constructed. See Envelope construction on page 14 for characteristics of good envelope construction.</td>
</tr>
<tr>
<td>High moisture content.</td>
<td>You might need to acclimate the envelope from the storage environment to your environment in order to diminish differences in heat and moisture. See Preparing print media for use on page 4.</td>
</tr>
</tbody>
</table>

Print-quality problems

Print-quality problems can be caused by the print media. Use this information to troubleshoot the problems.

Background toner particles

If the amount of background particles becomes unacceptable, the following procedures might help to clear the condition:

- Increase the toner density setting. This decreases the amount of background particles.
- Change the paper to a lighter basis weight.
- Check the printer’s environment. Very dry (low humidity) conditions can increase the amount of background particles.

Dropouts

If faded-out areas or character voids (partial print) occur randomly on the page:

- The moisture content of the paper might be uneven, or the paper might have moist spots on its surface as a result of environmental humidity. Store the paper in a moisture-proof container. Try removing the top few
sheets of paper from the paper tray or use paper from a different source (such as another ream), or try a different brand of paper.

- The paper lot is bad. The manufacturing processes can cause some areas to reject toner. Try a different kind or brand of paper.

**Improperly formed or wavy characters**

If characters are improperly formed or if the printer is producing hollow images, the paper stock might be too smooth. Try a different paper if characters are improperly formed.

**Toner smear**

- If toner smears appear on the leading edge of the paper, the paper stock might be too slick. Try a different paper if the toner is smearing on the paper.

- If toner is not fusing properly (and is smearing), try a higher fuser mode setting (if available). For more information, see the support documentation that came with your printer.

**Toner specks (background scatter)**

Toner specks are black dots that appear randomly on either side of the page. If the toner specks appear, the media might not meet the specifications for your printer (for example, the paper is too moist or too rough). For more information, see the support documentation that came with your printer.
4 Specifications

This appendix provides paper specifications.

- **U.S. paper grades**
- **Common paper grades and basis weights**
- **Weight equivalence table**
- **Standard media sizes used in laser printers**
- **Comparisons of paper smoothness**

**U.S. paper grades**

The U.S. paper-grading system defines the sizes and weights of different grades of paper.

The U.S. paper-grading system has evolved through custom and usage, resulting in similar papers having differently stated weights. For example, a 24-lb bond paper is exactly the same weight as a 60-lb book paper, or a 60-lb text, or a 33-lb cover. This is because basis weight is defined as the weight of 500 sheets of paper cut to basic size. The basic size for bond, book/text, cover, index, bristol, and tag are all different, so the given weights for these paper grades can be different although the physical weight is virtually identical.

**Common paper grades and basis weights**

This table identifies the basis weights for common paper grades. The basic size for each paper grade is unique, which affects the weight.

Standard media sizes used in laser printers

The tables in this section provide the English and metric dimensions of the most commonly used paper, envelopes, and cardstock.

- Paper sizes and dimensions
- Envelope sizes and dimensions
- Cardstock sizes and dimensions

**NOTE:** See the support documentation that came with your HP LaserJet printer for details about the media that the printer supports. Use only media that is supported.

**Comparisons of paper smoothness**

Smoothness is typically expressed in terms of Sheffield, Gurley, Bekk, or Bendtsen units. HP LaserJet printers generally require a smoothness of between 100 and 200 Sheffield.
Figure 4-1 Comparisons of paper smoothness

Gurley S-P-S (S PSI) (SEC/100 CC)  
Bekk (SEC/10 CC)  
Bendtsen (1 KG/CM²) (CC/MIN)  
Sheffield (CC by 10⁻²/MIN)
You can order HP print media from HP or from a local reseller.

If you are interested in purchasing HP print media, go to the website https://hppaper.com/.

**NOTE:** When ordering media, reference GSM or grams/square meter. There can be confusion about the meaning of "lb" (for example, 75 GSM is 20lb Bond, 28lb Cover, and 42lb Index). If you are unsure, refer to the GSM specifications when ordering media. See also Weight equivalence table on page 36 for the equivalent weights for different grades of paper.

To order HP print media outside the U.S., contact your local sales office.
A-series of paper sizes
The ISO A-series of paper sizes is based on the Lichtenberg Ratio, which is an aspect ratio of 1 to the square root of 2. A0 size paper is 841 by 1,189 mm in size, which is 1 square meter in area and has a 1.414:1 aspect ratio. Each subsequent size is half the area (determined by halving the long dimension). If the value is an odd number (for example, 1,189 mm), then the subsequent value after halving is truncated (for example, 594 mm). The aspect ratio of 1:1.414 is maintained throughout the A-series of paper sizes.

Basic size
Basic size is a specified size for a grade of paper. Basic sizes have evolved from custom and usage.

Basis weight
Basis weight is the weight of a ream of paper (500 sheets) that has been cut to the basic size. Basis weight is an important characteristic of paper. Paper that is too light or too heavy can cause misfeeds, misstacking, jams, poor print quality, or excessive mechanical wear to the printer.

Brightness
Brightness refers to the reflectance and whiteness of a sheet of paper. Higher brightness papers are more expensive to produce and are usually associated with higher quality.

Caliper
Caliper is the thickness of a sheet of paper or other print media. It is typically specified in mils (one-thousandth of an inch) or millimeters. It is closely associated with paper weight but not directly associated, because some papers have more bulk (more density) than others.

Carrier sheet
The carrier sheet is the sheet to which labels are temporarily attached. Usually this sheet has a “slick” feeling or appears shiny.

Composition
Composition (furnish) is the mixture of various materials, such as fiber, filler, sizing materials, and other additives, that are used to make the paper stock. Fillers such as calcium carbonate, clay, or talc are added to paper to fill in the spaces between fibers.

For optimum performance of your HP LaserJet printer, use paper that is made from 100 percent chemical wood pulp or cotton fiber. Recycled paper, made with no more than 5 percent groundwood, is also acceptable. To ensure that paper of a special fiber composition will work correctly in your printer, test it before purchasing large quantities.

Copier paper
A grade of paper that is suitable for printing in the electrophotographic process. This paper is characterized by having a smooth finish, heat stability, non-curling qualities, and good aesthetic properties (such as color, brightness, and cleanliness).

Curl
The amount of curvature or wave in a sheet before or after printing. Sheets might curl before printing if they are exposed to humid conditions or very dry conditions. Residual stresses in the sheet or high moisture content can also affect the level of
curl after printing. Good process control by the paper manufacturer and proper paper storage and handling will minimize curl problems.

Curl is typically measured by laying the sheet of paper on a flat surface and measuring the height of the corners. There are two types of curl:

- In-ream curl is the amount of curl in a sheet of paper before printing. In-ream curl results from the paper-manufacturing process or from exposure to the environment. Paper with excessive in-ream curl might lead to feeding and print-quality problems.

- Post-image curl is the amount of curl in a sheet of paper after printing. Post-image curl results from exposure to the fusing process and the paper path in the printer. Paper that has excessive post-image curl can be difficult to handle or to use in automatic-feed photocopiers.

**cut-edge condition**
Condition of the edges of paper, which can affect paper’s ability to feed properly.

cutouts
Any portion of the media that has been removed, including binder holes, notches, square cuts.

density
Relative darkness of the print.

die-cuts
Cuts between individual labels. Die-cuts are made by a machine in a predefined pattern.

duplexing
Printing on both the front and back sides of a sheet of paper.

electrical properties
The electrical resistivity of the print media. The electrical resistivity of the paper is one of the most important properties for copier- and laser-grade papers. If resistance is too high, static buildup problems can occur with paper handling and print quality. If electrical resistivity is too low, poor image transfer and low density can result. Generally, paper has very high resistance, so paper manufacturers add salts or other materials to lower the resistivity.

face sheet
The face sheet is the printable surface on a sheet of adhesive labels. It can be made from different materials, including paper, polyester, and vinyl. It is common for a face sheet to be die-cut so that individual shapes can be removed after printing. Polyester and vinyl labels require a topcoat to provide the proper electrical and toner adhesion properties. It is important to purchase labels from a knowledgeable supplier who is familiar with these processes and with laser printing.

felt side versus wire side
Some methods of manufacturing paper result in two-sided paper that has properties that differ from one side to the other. Along with other process variations, these properties can make one side of the paper the preferred side on which to print. The “top” side of the paper sheet, as it is formed, is known as the felt side. The “bottom” side is known as the wire side. Most manufacturers indicate the preferred printing side on the package. See Reading a ream label on page 5.

finish/smoothness
Characterizes a paper’s finish. Textured paper causes inconsistent or blotchy print and can wrinkle. Printed output on textured paper might have broken character edges and show poor toner adhesion. Glossy-smooth paper tends to highlight defects and might not hold toner. For best results, use smooth paper.

Paper for laser printers should not have a heavy texture or a glossy smoothness unless the paper is specifically designed to work with your HP LaserJet printer. If you want to use a glossy paper in the HP color LaserJet printer, try HP’s soft gloss and high gloss paper (see Ordering HP print media on page 41). For sharp resolution or detail, use a smooth paper.

Paper finish is typically measured by using air-leak methods. We recommend a range for smoothness that uses the Sheffield method. Equivalent values for other methods can be found in Comparisons of paper smoothness on page 39.
Avoid using paper that has embossed or raised surfaces, because spotty printing and misfeeding can occur. It is possible to print satisfactorily on paper that has embossed areas in the leading edge, trailing edge, or areas where print will not appear on the paper; however, misfeeding or jamming can occur.

**finishing precision**
Dimensions (length and width) of a piece of media, how closely it is cut to the stated size, and how square it is. Use media that is accurately cut, so that it can be handled properly.

**furnish (composition)**
Composition (furnish) is the mixture of various materials, such as fiber, filler, sizing materials, and other additives, that is used to make the paper stock.

**fusing compatibility**
Compatibility of print media used in the printer and how it reacts when exposed to the fuser temperature of:

- 205°C (401°F) for 0.1 second (0.2 second for HP color LaserJet printers) for paper, labels, and envelopes; and
- 205°C (401°F) for 0.1 second (0.4 second for HP color LaserJet printers) for overhead transparency materials.

Print media should not discolor, melt, offset, release undesirable emissions, or break down in any way when exposed to these temperatures for the specified time period.

**grain**
The orientation of paper fibers in paper. Fibers tend to align themselves in the process direction of the paper machine. Papers are stiffer in the grain direction. Most cut sheet papers are cut long grain (that is, with the grain direction parallel with the long edge of the sheet). For heavier-weight papers (greater than 135 g/m² in weight), HP recommends using short-grain paper, if available, to improve feeding and reduce wear to the paper path.

**grammage**
Grammage is the metric standard for specifying paper weight and is expressed in grams per square meter.

**gray background**
Paper looks gray or appears dirty because small toner particles are transferred to non-printed areas (white space), and can be corrected by changing paper or increasing the toner density setting on your printer. This condition is a symptom of a print-quality problem.

**groundwood**
Wood fibers that are extracted using a mechanical rather than a chemical process. Groundwood papers are generally weaker than chemical-wood papers.

**ISO**
International Standards Organization.

**JIS**
Japanese Industrial Standards.

**MFP**
Multifunction peripheral; also known as multifunction product or multifunction printer.

**mils**
One mil equals 0.001 inches.

**moisture content**
How much moisture print media will absorb or lose, depending on the humidity in the surrounding air.

Paper is hygroscopic, that is, it will absorb or lose moisture depending on the humidity in the air around it. The moisture content of paper has a great effect on its resistivity. Paper will absorb moisture in a high-humidity environment and lose
moisture in a low humidity environment. Small increases in moisture content greatly reduce resistivity while small decreases in moisture content greatly increase resistivity.

Moisture content can also affect other paper properties such as curl, stiffness, and dimensional size. Higher moisture content can make paper prone to curl and wrinkling during printing, make a sheet limp, and increase the dimensions of a cut sheet. Paper performance can change significantly with seasonal or weather changes, which affect the humidity in the printing environment.

**Packaging**
Packaging is an important consideration when using paper in an HP LaserJet printer, because adequate packaging maintains the correct level of moisture and protects paper from damage during transport and storage.

**Perforations and micro-perforations**
A hole or series of holes punched through the paper to aid in the separation of one piece of paper from another.

**pH**
Refers to the acidity/alkalinity of paper as determined by the TAPPI (Technical Association of the Pulp and Paper Industry) cold-extraction method.

**Photocopy paper**
See copier paper.

**Post-consumer waste**
Manufactured material that the customer has used. Post-consumer waste can be office paper, mail, used boxes, old newspapers, or magazines.

**Pre-consumer waste**
Material that never reaches the customer after it has been manufactured. Pre-consumer waste can be unused paper stock, bindery trimmings, envelope cuttings, business forms, or unsold books or magazines.

**Print media**
Paper, envelopes, cardstock, overhead transparencies, and labels that are used with printers. Print media used in HP LaserJet printers must meet the guidelines and specifications listed in this guide.

**Ream**
A ream is a quantity of 500 sheets of paper. Paper is often packaged and sold in reams.

**Simplex**
Printing on one side of a sheet of paper.

**Smoothness**
Surface smoothness is determined by measuring the rate of air flow between the sheet surface and a flat reference surface. Smoothness usually is expressed in Sheffield or Bekk units.

**Stiffness**
How resistant print media is to bending or flexing. A minimum stiffness is required in order for paper to separate from the rollers inside of the printer. Most long-grain papers that are heavier than 60 g/m² will have adequate stiffness to transport through the printer. Generally, stiffness increases with paper weight.

**Surface roughness**
Surface roughness of papers can affect print quality, feeding, and fusing (toner adhesion). If paper is very smooth, background particles are more easily seen, and sheets tend to stick together and create multiple-sheet feeds. Very rough papers can degrade transfer of toner onto the page, causing jagged edges or toner scatter. Fusing (toner adhesion) can also be drastically reduced on very rough papers. Roughness is usually measured using an air leak method such as the Sheffield method. Typical Sheffield values for different paper surfaces are in the following approximate ranges.
- 120 to 150 for photocopy grades (wove or regular finishes)
- 40 to 60 for very smooth laser or coated grades
- 250 to 300 for cockle finishes
- greater than 350 for traditional linen and laid finishes

**waste paper**
A generic term used for post-consumer waste and some pre-consumer waste.

**watermark**
An impression made in a wet sheet of paper as it is being manufactured. Watermarks are visible when the sheet is held up to light. They appear as a word, symbol, or other impression.
